HALQA

The Nine Reports — v3, expanded · 2026-07-13 · prepared for the chairman

Report 1 — MASTER PRODUCT REPORT (v3, expanded)

Everything that exists in Halqa, how it fits together, why each piece is shaped the way it is, and exactly where the Shariah line runs.

State as of 2026-07-13 · verified by 25 unit + 262 end-to-end checks (run twice consecutively), both typechecks, production build, and a manual UI walk on desktop and phone widths — including the Urdu toggle and the bank receivables export, exercised live in the browser.

0. The one-breath version

Halqa is Pakistan's committee (kameti/BC/ROSCA) made digital and honest: the same contribute→rotate→collect loop people already trust, plus four things paper can never do — enforcement instead of blind trust, real halal profit on idle money, a portable credit identity, and total honesty about what is halal and what is not. In Stage 1 **money is recorded, never held**: members pay each other directly and Halqa keeps the enforceable ledger. There is no pot to steal because there is no pot.

1. Why the committee, and why record-only (the two founding decisions)

- **Why the committee:** it is the one financial instrument the market already runs at national scale (~41% participation, ~US$5B/yr rotating). Halqa creates no new behaviour; it removes the three flaws of the existing one — fragility (one abscond destroys months of savings), zero yield (the pool idles while inflation eats it), and invisibility (twenty years of discipline builds no credit file).
- **Why record-only:** custody is what turns a committee app into a regulated financial institution — and custody is what every historical committee fraud actually was (a single operator holding everyone's money). Stage 1 deliberately holds nothing: members transfer to each other over Raast/wallets/cash and record the reference; Halqa enforces the schedule, the collateral, the scores and the ledger. Custody arrives only with the SECP NBFC licence (the path Oraan proved: SECP/LRD/107/OFSPL/2023) or a regulated custodian partnership. This is simultaneously the compliance posture, the trust pitch, and the security model.

2. The member journey, screen by screen

- **Auth** — register (starts at reliability score 700) or sign in; optional **referral handle** at signup (the referrer earns a loyalty bonus when the new member completes a first full cycle — funded from Halqa's own share, never from members). Passwords changeable in-app (Profile → Security); a password change signs out all other sessions.
- **Dashboard** — next installment, next payout, recorded savings, your circles; "Host a committee" gated at score 700. Assalam-o-Alaikum greeting, streak chip, updates count.
- **Language** — a one-tap **English ⇄ اردو toggle** in the sidebar flips the app to Urdu with full right-to-left layout, instantly, on every open screen. First-touch surfaces (navigation, home hero, trust banner) ship translated; deeper pages roll out on the same dictionary. In a market where only 24% of women own a phone and most onboarding is assisted, the person helping a new member is often more comfortable in Urdu — the toggle is an inclusion feature, not a cosmetic one.
- **Circles** — your committees + join by invite code, with a **pre-join preview** (terms + the host's verified reputation card) *before* committing. Two join guards run server-side:
  - a reliability floor (score ≥ 550), and
  - the **first-circle cap**: a member who has never completed a full cycle anywhere on the platform cannot join a circle above **Rs 25,000 per installment**. Newcomers prove themselves in small circles before touching big money — the same graduated-exposure logic a good host applies socially, now enforced in code. Complete one clean cycle and the cap lifts forever.
- **Create flow** (host) — deliberately simple-first:
  - Basics: name, members 3–30, contribution, period 7–365 days, optional **goal tag** (Hajj/education/wedding/home/business + custom name).
  - **Profit engine** (the star, in plain language): tick levers — Earn on idle money (Sukoon base) · Patience pays (Bazaar) · Monthly gift draw · Early-turn fee (conventional). The named tier (Classic/Sukoon/Bazaar/Priority/Sigma) is derived live with a halal/not-reviewed chip, so the host always knows which side of the line she is configuring.
  - **Gold hedge** (optional): put 5–50% of every pool into the gold-linked allocation with live estimated growth; auto-guards (hidden in Investment mode; disabled under 10-day periods because gold needs 3 days to liquidate before payout).
  - **Anti-default panel**: holdback, penalties, locks, nudges, deposits, guarantor.
  - **Advanced (off by default)**: only here do risk bands (Low/Med/High auto-selecting the best eligible scheme), the scheme picker, and the allocation slider appear. A first-time host never meets an allocation slider.
- **Committee page** — hero (payout, your position, round), engine banner with full disclosure, five tabs: Turns & people · Payments (record installment with rail + reference) · Growth (host deploy/liquidate within the locked mandate) · Protection (live safeguards, collateral coverage %, peer nudges, commitments) · Chat (members-only, real-time).

- Hosts additionally get the **Bank pack** button (Payments tab, active circles): one tap exports a bank-facing JSON statement of the circle — future-round inflow schedule, per-round and total expected receivables, each member's reliability score, KYC level, on-time percentage and collateral held, plus the record-only disclaimer. This is the artifact a host (or Halqa, at partnership scale) hands a banker who asks the two questions bankers actually ask about committees: *what receivables are coming, and how reliable are the payers?* It turns a social arrangement into an underwritable schedule.

- **Market** — turn trading: free swaps only in halal tiers; premium listings/bids (≤50% of payout) in conventional tiers only, and labelled as such.
- **Terminal ("Growth laboratory")** — two tabs: **Halqa earning & gold** (the four engine sleeves with their roles + estimated 1-year growth on Rs 100k) and **Market investments** (26 schemes, sort by return/risk, Low/Med/High/Extreme band chips, per-scheme education, projection modeller). Crypto appears only at ceiling 10 with a red banner + double-confirm.
- **Profile** — score ring + credit events; **Sukoon Vault** (parking, top-ups, four yield tiers, auto-cover toggle, full sweep); Credit Passport generator; change password.
- **Rafa** — free-floating 3D assistant: reacts to real actions (pay→nod, deposit→coin, create/payout→celebrate), idle animations, a real-time page-following walkthrough for new members, and a ~120-intent FAQ chat (greetings included) with honest fallbacks — when Rafa doesn't know, Rafa says so rather than inventing. Present on every screen including inside committees; becomes a bottom sheet on phones.

3. The five committee tiers — and the exact Shariah map

Tier	Mechanics	Shariah status (as labelled in-app)
Classic	Pure rotation; no engine	Neutral (no investment activity)
Sukoon	Float sweep (~10.8% money-market) + deposits earn Mudarabah (~11.2%) paid to the depositor	**Halal structure** 🟢
Bazaar	Sukoon + patience tilt: float + deposit yield pooled, split by capital-days × weight 1.0→2.0× (first→last turn)	**Halal structure** 🟢
Priority	Early-turn fee ≤10% deducted from the early member's own payout, declining to 0%, redistributed to waiting members	**NOT Shariah-reviewed** 🟠 (prices early access)
Sigma	Everything at once; fee optionally pooled through the patience split; reference max bonus **Rs 16,982/yr** (CI-locked)	**NOT Shariah-reviewed** 🟠

The complete Shariah map (memorise this):

- 🟢 Halal by design: float sweep · Mudarabah deposits · patience tilt · early-bird boost · staking streak · vault Standard/Income/Gold tiers · penalties→charity · free turn swaps · goal circles · the referral bonus (paid from Halqa's own Mudarib share — member money is never touched).

- 🟡 Halal-intent, pending formal board sign-off: the prize draw (hiba — principal never staked, deterministic draw).
- 🟠 Labelled NOT Shariah-reviewed: the early-turn fee (Priority/Sigma) · turn-market premium sales · vault **Crypto** tier.
- The label appears at: tier picker chips, engine summary, committee-page banner, consent text, vault tier buttons, terminal scheme cards, and both crypto confirm modals. A fully halal path is always one tap away, and the conventional path is never mislabelled to capture a fee.

4. The earning levers (each explained, with its design reason)

- **Float sweep**: every paid contribution earns the Islamic money-market rate for the exact days it sat before payout (clamped so backdating can't fabricate profit); realised each round net of Halqa's 5% share. *Design reason: this is the profit that exists in every committee and has been wasted for a century — capturing it requires changing nobody's behaviour.*
- **Deposits that earn**: security deposits accrue ~11.2% Mudarabah all cycle; Sukoon pays the depositor, Bazaar/Sigma pool it into the tilt; principal always returns in full. *Design reason: collateral that costs the member nothing is collateral nobody resents posting — protection and profit from the same rupees.*
- **Patience tilt**: completion profit splits by capital-days × disclosed position weight (1.0→2.0×). *Design reason: the late turns carry the committee (and the inflation cost); paper committees never compensated them — this is the fairness correction that makes late positions desirable rather than punitive.*
- **Early-bird boost**: ≥75% of payments made 3+ days early ⇒ 1.25× profit weight. *Self-funding: early money is what creates the float profit being shared.*
- **Staking streak**: +5% float bonus per consecutive clean round (cap +20%); any late payment resets. *Collective discipline literally pays — the group polices itself.*
- **Prize draw (opt-in)**: half a round's net float profit gifted to one on-time payer, chosen by a replayable deterministic hash; principal never staked. *The kameti-culture "lucky draw", rebuilt so it stakes nothing.*
- **Priority/Sigma fee**: ≤10%, deducted from the early member's own payout, redistributed to the waiting members — Halqa keeps none; Sigma can pool it through the tilt (that is what reaches Rs 16,982). *Quarantined, capped, opt-in and labelled — the one conventional mechanic, priced transparently instead of by auction.*
- **Gold hedge**: 5–50% of each pool into the gold-linked allocation (~15% indicative) — the culturally-trusted inflation hedge, the same asset that backs roughly half of some MFB loan books.
- **Referral loyalty**: Rs 250 to the referrer when a referred member completes their **first full cycle** — not at signup. *Paying on completion, not registration, means the incentive rewards exactly the behaviour the platform needs (finished, clean circles) and cannot be farmed by fake signups. Funded from Halqa's own platform-fee share; strictly once per referred member, enforced at the ledger level.*

5. The Sukoon Vault (the personal layer)

- **Parking**: payouts stay recorded in the vault, earning, until swept — the single highest-leverage behaviour for both the member and Halqa's revenue line.
- **Top-ups**: any amount from Rs 100; no committee needed — the vault works as a standalone halal savings pocket.
- **Four tiers**: Standard ~10.8% 🟢 · Income ~12.1% 🟢 · Gold ~15% 🟢 · **Crypto ~30% "rate" (speculative)** 🟠 — the crypto tier is switchable only through a UI double-confirm **and** an API-level `acknowledgeExtremeRisk` gate (the server refuses a silent switch with HTTP 428), affects only the personal vault, and can never touch committees. It exists to prove the system can say no.
- **Sweep**: full withdrawal anytime — principal + accrued profit − 5% Mudarib share on profit only.
- **Auto-cover** (opt-in): an overdue installment settles itself from the member's vault via the standard settlement path — the late penalty and score hit still apply (fair to the group), but the miss never escalates toward default. The member's own savings become their default insurance: no pool, no premiums, no moral hazard.

6. The default-protection stack (every layer coded and tested)

1. **Score gates**: 550 to join, 700 to host; +6 early / +4 on-time / −10/−20/−40 late / +25 clean completion.

2. **First-circle cap**: unproven members (zero completed cycles) limited to circles of ≤ Rs 25,000/installment — exposure graduates with demonstrated behaviour.

3. **Graduated deposits** sized to position — early turns owe the group more, so they post more: deposits now cover **90% of a member's remaining dues** (capped at 95% with credit adjustments). Productive collateral that earns while protecting; always returned in full.

4. **15% payout holdback**, released after clean follow-up payments (and force-released at completion — a stuck-holdback bug was found and fixed by test, which is the point of having 262 of them).

5. **Credit-weighted ordering** — reliable members occupy the risky early slots by default.

6. Reminders → **calibrated post-due grace window** (an internal fraction of the period, clamped 2–14 days; deliberately never shown in UI so it cannot be gamed) — penalties/score apply during it, escalation waits.

7. **Progressive fixed penalties** (2/5/10% bands, never compounding). Destination: **charity** in halal tiers; never-late members otherwise; unused reserve refunded at completion.

8. **Vault auto-cover** (above) · optional guarantor · post-payout default ⇒ platform ban + collateral forfeiture + open recovery case with a rehabilitation path (clear dues + fee ⇒ restored with cooldown).

9. Live **collateral-coverage %** shown to each member in the Protection tab — protection you can see.

- **Quantified**: calibrated 100k-member simulation — defaults **1.41% → 0.27%**, recovery on default **0% → 90.4%**, defaults fully collateralised **70%**, worst segment (overcommitted) 7.95% → 0.83% — locked by 8

CI assertions including dual-seed robustness. The coverage raise to 90% is what pushed recovery from the mid-80s to 90%+.

7. Reputation & trust surfaces

- **Credit Passport**: signed export (clean completions, on-time %, total recorded) with a public verification link any lender can check without a Halqa account; 90-day validity; regenerable. The informal economy's first exportable credit file.
- **Bank receivables pack** (host-side): the institutional counterpart of the Passport — where the Passport proves a *person*, the pack proves a *circle*: forward inflow schedule + member reliability + collateral held, exportable in one tap.
- Host reputation card at join-time; pre-join preview; committee chat; live protection matrix with peer nudges.

8. The catalog (31 schemes)

- **Engine sleeves** (shown separately): Islamic money-market (float/Standard) · Islamic Mudarabah deposits · Islamic income fund (Income tier) · gold-linked (Gold tier / gold hedge).
- **Market universe** (advanced investing only): T-bills/PIBs, National Savings certificates, sovereign & corporate sukuk 🟢, money-market/income/balanced/asset-allocation/equity funds, PSX ETF (~18%), Shariah equity fund 🟢, REIT 🟢, Murabaha trade finance 🟢, microfinance deposits, private credit, multi-asset, **Digital Asset Basket (Crypto)** — risk 10/10 EXTREME, not government-backed, barred from committees.
- Every card: dated rate + "rate verified" stamp (stale-rate warnings), liquidity days, volatility/credit inputs, source link, plain-language "what this actually is" education.

9. Engineering facts (meeting-grade)

- React + TypeScript + Vite front (PWA: manifest, theme-color, installable to a phone home screen; responsive layout with bottom-sheet assistant; Urdu/RTL localisation layer); Node/Express + Prisma/PostgreSQL back; Socket.IO chat.
- **Integer paisa everywhere on a double-entry ledger** — every entry carries debit, credit, reason code, reference and an idempotency key; every balance reconstructible from first principles; profit conservation asserted by tests (bonuses across a cycle sum exactly to real profit created — the ledger cannot invent a rupee).
- **25 unit/property tests + 262 integration checks** across the full lifecycle — the Rs 16,982 promise, the simulation's headline claims, the first-circle cap, the referral bonus's once-ever guarantee, the receivables pack's host-only access, crypto gating, password rotation — re-run-safe and self-healing; CI runs typecheck + tests + build on every change.

- Structured JSON request logs, DB-checked health endpoint, rate limiting (strict in production), hourly delinquency scheduler, root error boundary.
- Bank-custody/guarantee rail fully built against a production-shaped sandbox, feature-flagged OFF (one flag restores it when a partner and a licence exist).

10. Honest boundaries — say these before anyone asks

- **No custody, no real deployment** until the SECP NBFC licence; all yield is computed at dated indicative rates and labelled "never guaranteed."
- Prize draw pending Shariah-board sign-off; Shariah claims are design-intent, not a fatwa — and the app says so.
- No self-service password *reset* while logged out yet (change-password exists in-app); no support inbox beyond chat + the assistant; no migrations/backups/staging yet; simulations are calibrated models, not ledger history — replacing the model with real ledger data is what the pilot is for.

Report 2 — PRESENTATION BULLETS (v3, expanded)

Speak from these. Left column of your mind: the bullet. Right column: the number that proves it. Below each slide: what to do with your voice and what he is thinking while you talk.

Slide 1 — Title (20s)

- "Halqa — the committee, made safe and rewarding."
- Framing sentence: "I'm going to show you one product and one habit that half this country already has."
- Posture: you are presenting a *finished, tested prototype*, not an idea. Calm beats hype. Do not thank him for his time twice.
- *What he's thinking:* "Is this another wallet deck?" Your first slide's job is to signal it isn't.

Slide 2 — The problem (40s)

- Every family runs or knows a committee; every family also knows a horror story.
- **Fragile**: one member takes the pot and vanishes → months of savings gone, 0% recovered, relationships wrecked. (Karachi's Rs 400M online-committee fraud is the cautionary tale everyone in finance knows — name it before he does.)
- **Unrewarding**: the pool sits idle between payments while double-digit inflation eats it — a paper committee is melting ice.
- **Invisible**: twenty years of flawless payments builds zero credit history — the discipline evaporates the day the circle ends.
- *Voice:* slow down on "zero percent recovered." That number is the emotional core of the pitch.

Slide 3 — The habit is the market (40s)

- **~41%** of Pakistanis have participated in a committee; **~US$5B** rotates annually (Oraan research, TechCrunch).
- Pakistan holds a giant share of the world's unbanked (1 of 8 countries with ~650M of 1.3B, Findex 2025); **~30-pt** gender gap; only **24%** of women own a phone vs 89% of men — so host-led, assisted models win here, not self-serve bank apps. (This is also why the app ships with a one-tap Urdu mode — the person onboarding a new member is often more comfortable in Urdu.)
- Punchline: "We don't create the behaviour. We remove its three flaws."
- *What he's thinking:* he knows these numbers better than you. The point is not to teach him — it's to prove you did the reading.

Slide 4 — The product (60s)

- Same loop people trust: contribute → rotate → collect. Zero re-education needed.
- Four additions paper can't do:
  - **Protection** — deposits sized to 90% of what each member still owes the group, payout hold-backs, reliability scores, graduated exposure for newcomers (first circle capped at Rs 25,000 until one clean cycle), real consequences, an opt-in vault safety net that pays a missed installment from the member's own savings.
  - **Profit** — idle pool days + deposits earn on disclosed halal instruments, automatically.
  - **Reputation** — a portable, verifiable **Credit Passport**; discipline finally becomes an asset. And at the circle level, a **bank-ready receivables statement** any host can export — forward inflow schedule plus member reliability, the two things a banker actually asks about.
  - **Honesty** — halal labelled halal; the one conventional lever labelled "not Shariah-reviewed"; the word "guaranteed" never appears anywhere in the product.
- Trust architecture: "**We record, we never hold — there is no pot to steal.**" (Say it twice in the meeting. It answers the fraud question before he asks it.)

Slide 5 — How members earn (60s)

- Source 1 (creates value): real yield on idle money — money-market ~10.8%, Mudarabah ~11.2%, income ~12.1%, gold ~15% — all dated, all disclosed.
- Source 2 (moves value): optional early-turn fee, hard-capped 10%, from those who want cash sooner to those who wait; Halqa keeps none of it.
- Reference case: 12 members, Rs 140k pool → best member ≈ **Rs 17,000/yr** on top of savings; the whole group's real profit ≈ **Rs 69,000/yr**. Stress-tested floor ≈ **Rs 13,800** even at rates −30% with everyone paying on the due date — because the member-to-member component doesn't move with rates.
- Discipline levers: early-bird 1.25× weight, group streak +5%/clean round — behaviour that helps the group is exactly the behaviour that gets paid.
- *Voice:* pause after 17,000. Let him do the "on Rs 140k?" math himself — it holds.

Slide 6 — Market research (40s)

- All sourced, all re-verified: 41% / $5B (TechCrunch–Oraan) · Findex 2025 gaps · **PMN Dec-2024: 12.34M borrowers, Rs 604B loans, Rs 733B deposits, ~Rs 49k avg loan**.
- "The formal sector is the tip; the committee economy is the iceberg."
- *If he tests a number:* "I'll send you the sourced bibliography tonight" — and mean it (Report 3 has it).

Slide 7 — The microfinance opportunity (50s)

- MFBs' two hardest problems: **finding creditworthy borrowers** among the undocumented, and **mobilising cheap, stable deposits**.

- Halqa produces both as by-products: verified repayment histories (the Passport = an underwriting bridge for thin-file borrowers) and organised group savings (granular, sticky, low-cost — thousands of small savers instead of five big depositors).
- Third leg, new: **receivables-backed financing** — a circle's forward inflow schedule plus per-member reliability, exportable today. A bank that wants to finance against committee receivables finally has a statement to underwrite.
- "The committee becomes the credit bureau this sector never had."
- *This is the slide his career prepared him to hear. Slow down.*

Slide 8 — Competition (40s)

- Oraan proved everything hard: demand (10k+ savers, 84% women, 170+ cities), capital ($3.31M), and the **SECP NBFC licence** — the category is de-risked.
- Our depth vs their breadth: profit-sharing vs flat fee · we digitise **existing** circles (the host brings her own people — the social collateral stays intact) vs their stranger-matching · Shariah-labelled end-to-end · portable credit identity (nobody offers this) · simulation-quantified protection.
- Respect them out loud — it reads as confidence, not weakness.

Slide 9 — Business model (own slide, 40s)

- One line: **"5% of the profit we generate on idle money. 0% of savings."**
- Mudarabah alignment: members earn or we don't — survives any due diligence, any journalist, and any regulator.
- Scales on **earning balances** (pool float + vault) — one parked payout of Rs 120k outweighs dozens of tiny circles.
- Pass-throughs: early fees, premiums, penalties — 100% member-to-member or charity. Even the referral programme is paid from **our** share, not members'.
- *What he's thinking:* "finally, a take-rate that doesn't fight the customer."

Slide 10 — Goal & close (30s)

- Built: full platform, **25 unit + 262 end-to-end automated checks**, phone-installable, Urdu-ready, record-only by design.
- Next: SECP NBFC licence (the walked path) → custody → pilot circles → the Passport + receivables partnerships with lenders.
- Goal sentence: "Make Pakistan's own instrument safe, rewarding, and a door into the formal economy."
- Close by handing him the table: **"What drew you to this space?"** — then stop talking.

Delivery mechanics

- 6 minutes ≈ 870 words ≈ 145 wpm. Slower on slides 5, 7, 9. Pause after every number.
- Rules: never "guaranteed" · never "we hold money" · never an invented number · interrupted? answer in one sentence, then "that has its own slide — I'll land there in a minute."
- If tech comes up: React/TypeScript + Node/PostgreSQL, integer-paisa double-entry ledger, 262 automated end-to-end checks — then offer the audit: "your technical adviser is welcome under the hood." Operators trust audits, not adjectives.
- If Urdu comes up (it may — U Bank is a rural bank): flip the toggle live. An RTL flip in one tap is worth a paragraph of inclusion talk.
- Bring: phone with the live app installed to the home screen, the PDF dossier, and one printed one-pager.
- Rehearsal spec: twice aloud, timed, standing. The second run is always 40 seconds shorter; cut nothing until you've heard it.

Report 3 — MARKET RESEARCH + DIFFERENCE & UNIQUENESS (v3, expanded)

A. The market in five layers (each sourced, each with the "so what")

1. **The behaviour** — ~41% of Pakistanis have participated in a committee; ~US$5B rotates annually (Oraan research via TechCrunch, 2021). *So what:* demand needs zero education; the product's job is removal of flaws, not creation of habit. Customer-acquisition cost in this market is not an ad budget — it is the trust of one host, who brings 6–20 members with her.

2. **The exclusion that sustains it** — Findex 2025: Pakistan is 1 of 8 countries holding ~650M of the world's 1.3B unbanked; ~30-pt gender gap in accounts; 24% of women own a phone vs 89% of men. *So what:* the underserved majority is reachable through **hosts and groups**, not through solo app downloads — which is exactly Halqa's growth unit. It is also why the product ships Urdu-first-capable (one-tap RTL toggle): assisted onboarding happens in Urdu, not English.

3. **The adjacent formal market** — PMN MicroWatch Dec-2024: 12.34M active borrowers (~72% of ALL borrowers in the financial system), Rs 604B gross loan portfolio, Rs 733B deposits, ~Rs 48,971 average loan, 4,145 branches/139 districts. *So what:* an entire licensed industry already serves our exact demographic — as future partners (deposits + underwriting data + receivables financing), not competitors. The average microfinance loan (~Rs 49k) is almost exactly one committee payout — the two instruments are already interchangeable in members' lives; only one of them builds a credit file today.

4. **The rails** — Raast free instant P2P, ubiquitous wallets, rising smartphones. *So what:* "record-and-transfer" now costs members nothing new; the last cost barrier to digital committees quietly died. The state built our rails; we build the organiser on top.

5. **The precedent** — Oraan: founded 2018; first women-led fintech seed in Pakistan; US$3.31M (Jan 2024 close, Zayn Capital + Wavemaker); 10k+ savers, 84% women, 170+ cities; SECP NBFC licence SECP/LRD/107/OFSPL/2023; flat service fee; plans from Rs 1,000/mo; gold sold separately; does not lead with yield. *So what:* both demand-risk and regulatory-risk are demonstrably clearable — by a committee startup specifically.

B. Sizing, stated honestly (funnel, not fantasy)

- **TAM**: the $5B/yr committee flow across tens of millions of adults — the money already moves; nobody has to be convinced to save.
- **SAM**: the digitally-onboardable slice of the 41% — a defensible 15–25M adults over ~5 years as smartphone/Raast penetration climbs (and as assisted, host-led onboarding reaches the non-smartphone members through the host's device).

- **SOM (near-term)**: thousands of circles via host-led growth; the *monetisable* metric is **assets-earning-days** (pool float + vault balances), not signups — one engaged saver parking payouts is worth more than fifty idle downloads.
- The referral mechanic is sized to this funnel: Rs 250 per referred member, paid only when that member **completes a first full cycle** — so growth spend buys finished circles, not registrations, and it comes out of Halqa's own revenue share, preserving the "0% of savings" promise even in marketing.
- Guardrail sentence for investors: "I'll defend every input; I won't pretend a top-down billion-dollar TAM slide is a forecast."

C. Difference, opponent by opponent

- **vs paper committees** — they recover **0%** on default and earn **0%** on idle money; Halqa recovers **~90%** of defaulted exposure in the calibrated simulation (70% of defaults fully collateralised) and puts every idle day to work. Same trust, added spine. The paper committee is the true competitor — and it is beaten on its own values: safety and fairness, not gadgets.
- **vs Oraan** — facilitator/flat-fee vs our profit-share (5% of generated yield, 0% of savings): their revenue is indifferent to member outcomes; ours is identical to them. They form circles of strangers via their backend; we digitise **existing** circles (the host invites her own people), preserving the social collateral that skeptics correctly identify as the committee's real engine. Plus three layers that are not their play: Shariah labelling end-to-end, the Credit Passport, and the bank-facing receivables export.
- **vs banks/MFBs** — they need documents, minimums, branches; we need an invite code. They supply our instruments today and become our partners tomorrow on three concrete rails: deposit mobilisation (organised group savings), underwriting data (the Passport), and receivables-backed financing (the exportable circle statement). We are their distribution into the informal economy, not their rival.
- **vs wallets** — rails, not organisers: no groups, no enforcement, no yield-on-committee, no identity. Complements — members already pay each other over wallets and Raast; Halqa records the references. The wallet era's lesson (SimSim: free and first, still lost) is that features don't beat trusted distribution; our distribution *is* the trust network that already exists.
- **vs a copycat with AI tools** — the artifact is replicable; the judgment, the verification depth (262 automated end-to-end checks, ledger invariants, CI-locked simulation claims), the licence queue, the host trust, and the accrued reputation data are not (full argument in Report 7).

D. The uniqueness stack — six claims nobody else can make together

1. **Profit from idle money, never from members** — float sweep + Mudarabah deposits; the chit-fund riba-trap (auction-pricing early turns) deliberately avoided in the halal path; where a priced turn exists at all, it is capped, opt-in, labelled, and Halqa keeps none of it.

2. **Productive collateral** — deposits sized to 90% of remaining dues protect the group AND earn yield; principal always returns. Protection that pays for itself instead of taxing the saver.

3. **Portable reputation** — the Credit Passport: verified history checkable by any lender without a Halqa account; and its institutional twin, the **receivables pack**, which makes a whole circle underwritable. The informal economy's first exportable credit files — personal and group.

4. **Graduated exposure** — newcomers are capped at Rs 25,000 circles until one clean completed cycle; trust is earned in code the same way it is earned socially.

5. **Shariah honesty as architecture** — 🟢 halal engines structurally halal (variable profit, real assets, penalties→charity, free swaps); 🟠 the fee, premiums and crypto explicitly labelled not-reviewed; a fully halal path always one tap away. In this market, drawn lines *are* the brand — and the refusal to blur them is verifiable in the product, not claimed in a brochure.

6. **Quantified safety** — a calibrated, seeded, dual-armed 100k simulation (identical randomness across arms) with its conclusions locked in CI: defaults 1.41%→0.27%, recovery 0%→90.4%, 70% fully collateralised. Nobody else in the category publishes their default model, let alone tests against it on every build.

E. Why now — three tailwinds, one window

- Behaviour at national scale (no education cost) + rails just turned free/instant (no transfer cost) + regulator precedent set (no existential licensing doubt).
- The window: the category will consolidate around whoever adds **yield + identity + honesty** first. Oraan validated the market and holds the breadth position; the depth crown — profit engine, credit files, Shariah architecture — is unclaimed.
- The risk of waiting is not a competitor's feature launch; it is a competitor's *licence*. Regulatory queues are the real clock in this category.

Report 4 — BUSINESS MODEL + SIMULATIONS & BACKTESTING (v3, expanded)

A. The business model, from first principles

- **The asset we monetise:** idle time on other people's money — the days between a member's payment and the round's payout, the deposits held all cycle, and the balances parked in the vault. That time was economically dead in every paper committee for a century. Halqa is, at its core, a machine for noticing wasted days and paying their owners for them.
- **The structure:** classic **Mudarabah** — members are capital providers (rab-ul-maal), Halqa the working manager (Mudarib). Profit shared by a pre-agreed ratio; no profit → no manager's share. Our ratio: **5% of generated profit, 0% of principal.**
- **What we never touch (recite cold):** contribution principal · deposit principal · early-turn fees (100% member-to-member) · turn-market premiums (member-to-member; a 10% marketplace fee applies to premiums only, in conventional tiers) · late penalties (→ charity in halal tiers, → never-late members otherwise). Even the referral programme is paid out of **Halqa's own** fee share — Rs 250 to a referrer when the referred member completes a first full cycle — so growth spending never leaks into member money either.
- **Revenue lines today (simulated) and post-licence (real):**

1. 5% of float-sweep profit — every engine circle, every round.

2. 5% of vault profit — Standard/Income/Gold/Crypto tiers; always-on, independent of the committee calendar.

3. Post-licence expansions: custody margin, **Credit-Passport verification partnerships** with MFBs/lenders (underwriting data-as-a-service), **receivables-data feeds** (the exportable circle statement — forward inflows + member reliability — is the underwriting artifact for committee-backed financing), premium host tooling.

- **Why the shape is superior to a flat fee:**
  - *Alignment:* "if members don't earn, we don't" survives regulators, journalists and fiqh scholars alike. A flat fee on savings is a tax on the poor's discipline; a share of created profit is a wage for creating it.
  - *Balance-scaling:* revenue grows with wealth-per-member, not only member count — deepening beats churn-and-burn acquisition. The referral design reinforces this: it pays for *completed cycles*, the exact unit that deepens balances.
  - *Marginal economics:* an additional earning-day is a ledger row against a pooled instrument — near-zero marginal cost, fixed-share marginal revenue.

- *No credit risk on our book:* we don't lend; there is no cost-of-funds or NPL line. Defaults hurt members' circles (and we've built nine layers against them) but they do not sit on Halqa's balance sheet.

- **Illustrative steady state (shape, not promise):** 100k active savers · blended earning balances Rs 4–6B · ~11% blended yield → **Rs 440–660M/yr member profit** → **Rs 22–33M/yr Halqa** at 5%. Same cohort at double vault adoption roughly doubles our line without a single new user. That sensitivity — revenue doubling on *behaviour*, not acquisition — is the model's quiet superpower.
- **Cost base:** lean engineering + front-loaded compliance/licensing + cloud + assistant-deflected support. Contribution-positive early by construction.

B. The simulations — three instruments, one discipline

(Why simulate at all: no public dataset of real committee ledgers exists anywhere. The honest options are adjectives or a model with visible assumptions. We chose the model — seeded, reproducible, and now enforced by CI. The unusual part is not that we simulated; it is that the simulation's conclusions are automated tests: if a code change breaks a claim we make in this document, the build fails.)

B1. Harsh uniform stress test (`tests/monte-carlo.ts`)

- 100k members, deliberately hostile assumptions: 15% unreliable population, random turn positions, no deterrence modelling.
- Output: **7.28%** post-payout default; found that deposit+holdback at the *original* coverage levels fully covered only ~59% of worst-case (immediate post-payout) absconds.
- Its job was diagnostic — it drove two shipped builds: the **vault auto-cover**, and the **deposit-coverage raise to 90% of remaining dues** (early positions post more because they owe the group more). Quote it as "our own red-team": we attacked the design, published the wound, and shipped the fix.

B2. Pakistan-calibrated model (`tests/lib-pakistan-sim.ts` + runner + CI test)

- **Population:** 100k across five segments — salaried lower-middle 30% (Rs 40–90k), daily-wage informal 25% (Rs 28–48k), home-business women 25% (Rs 30–60k), young gig 12%, overcommitted 8% — incomes in PSLM/LFS-style bands; contribution burden 8–15% of income; committees of 8–15.
- **Stressors:** two Eid months (+10pp lateness), school-fee month (+6pp, 1.4× shock rate), per-segment monthly income shocks (5–18%), burden-scaled lateness. The model deliberately makes life hard in the months Pakistani households actually find hard.
- **Design integrity:** both arms replay **identical seeded randomness** — same people, same shocks, same bad months — so paper-vs-Halqa differences are caused *only* by the modelled measures. Each modelled measure maps 1:1 to a shipped mechanism (reminders ×0.70 lateness; ban/passport deterrence ×0.60 abscond; 15% auto-cover adoption at 80% effectiveness; graduated deposits at the live 90% curve + 15% holdback recovery; credit-weighted ordering).
- **Results (paper → Halqa):** post-receipt defaults **1.41% → 0.27%** · recovery **0% → 90.4%** of exposure · defaults fully collateralised **70%** · pre-receipt dropouts 1.06% → 0.36% · on-time 84.4% → 88.9% ·

overcommitted segment 7.95% → 0.83%.

- **Reading those numbers like an operator:** the headline is not the five-fold default reduction (deterrence models are arguable); it is the **recovery line**. Even when someone does abscond, nine-tenths of the exposure comes back from collateral already in the system — that is a *structural* claim about deposit sizing, not a behavioural guess, and it is the direct dividend of the 90% coverage curve.
- **Now CI-locked (8 assertions):** determinism (same seed ⇒ identical output) · segment shares within ±1% · burden inside 8–15% · ≥3× default reduction · >60% recovery · dropout & on-time improvements · risk ordering sane (overcommitted worst, home-business women best) · **conclusions robust under a second seed**. A careless edit can no longer silently change the numbers we quote.

B3. Bonus backtest (`tests/bonus-backtest.ts` *)*

- The engine's own integer math swept across **rates ±30% × payer behaviour** (round-open / 10-days-early / 3-days-early / due-date payers) for the Sigma-pooled reference circle (12 members, Rs 140k pool, fee fixed at 10%).
- The grid, current engine: best cell (day-one payers, base rates) **Rs 17,319** · the CI-locked canonical promise **Rs 16,982** · worst cell (rates −30%, everyone pays on the due date) **Rs 13,821**.
- Why the floor holds: the fee component (~Rs 9,334 through the patience split) is member-to-member and rate-independent; only the real-yield component breathes with rates. Even Pakistan's rate cycle cannot take the bonus below five figures in the reference case.
- The tier ladder underneath (same circle, levers added one at a time): Classic Rs 0 → Priority ~7,600 → Bazaar ~7,650 → Sigma monthly **15,285** → Sigma pooled **16,982**. Note that the Rs 15,000 promise now clears at the *monthly* rung — pooled mode is upside, not a requirement.

C. Present it in three sentences

- "We red-teamed the design with a harsh 100k stress test, then built a Pakistan-calibrated model — five income segments, Eid and school-fee seasonality, income shocks — where both arms live the identical random life with and without our protections."
- "Defaults drop about five-fold, recovery goes from zero to ninety percent — and those exact claims are automated tests: the build fails if a change breaks them."
- "And before you ask: it's a calibrated model, not history — replacing it with our own ledger data is precisely what the pilot is for."

Report 5 — DEFENSE: HARD QUESTIONS & COUNTERS (v3, expanded)

Every side covered: legitimacy, business, competition, risk, Shariah, regulatory, team, tech. Each answer is worded to be said aloud — practice the wording, not just the idea.

Meeting mechanics before any answer: pause one beat · answer only what was asked · end with a period, not a ramble · a written follow-up beats any bluff · after two answers, ask HIM something back (control returns to whoever asks questions). If a question has a number in it, your answer should have a number in it.

A. Legitimacy & trust

- **"This is a Ponzi / MLM / too good to be true."** → "A Ponzi needs two ingredients: opacity and guaranteed returns paid from new deposits. We have neither — the word 'guaranteed' doesn't exist in the product, yield comes from disclosed dated instruments, and every rupee lives on a double-entry ledger anyone can audit. Our product *is* the transparency."
- **"People get scammed by online committees — Karachi, Rs 400 million."** → "That fraud, and India's chit scandals, share one root: a single operator held everyone's money. We are structurally the opposite — record-only; members pay each other directly; there is no central pot to run away with. Custody only arrives with the SECP licence and a regulated custodian."
- **"Why would anyone trust an app with their committee?"** → "They don't have to at first — that's the design. Stage 1 asks for zero custody trust; it earns behavioural trust through one clean, enforced, transparent cycle. Then the relationship deepens. Even our newcomer rules mirror this: a first-timer can't join anything above a Rs 25,000 circle until they've completed one clean cycle — trust is graduated in code exactly the way a good host graduates it socially."
- **"Committees are legally grey."** → "Private mutual savings among known members is a centuries-old lawful arrangement. What triggers licensing is custody and deployment — exactly the two things we deliberately haven't switched on."
- **"What if a host sets up circles to defraud her members?"** → "The host never touches the pot — there isn't one; payments are member-to-member with references. What a bad host *can* do is organise unreliable people, and that's priced: her reputation card is public at join-time, her members' reliability is scored, and her circle's collateral coverage is visible to every member live."

B. Business & economics

- **"How do you make money?"** → "Five percent of the profit we generate on idle money. Zero percent of savings. No member profit, no revenue."

- **"That's a tiny take."** → "Per circle, yes; the model scales on balances, not fees — pool float plus a personal vault that grows independent of the committee calendar. A take-rate on value *created* also survives regulation, journalism and fiqh review; fee-extraction models increasingly don't."
- **"Show me unit economics."** → "Marginal cost of an earning-day is a ledger row; marginal revenue is 5% of real yield; CAC is structurally low because a host brings 6–20 members with her — and our referral spend pays out only when a referred member *completes a full cycle*, from our own revenue share, so growth money buys finished circles, not downloads."
- **"Year-one revenue?"** → "The honest driver is licence timing, so I'll give you the shape, not a promise: at 100k savers and realistic balances, tens of millions of rupees a year, doubling with vault adoption alone."
- **"What's the exit?"** → "Natural acquirers are MFBs and digital banks buying a deposit rail plus underwriting data — but we're building for durable cash flow, not a flip."
- **"Why hasn't Oraan done the yield layer?"** → "Their flat fee doesn't require it, and adding it would cannibalise the fee. Innovator's dilemma — our head start."
- **"How would a bank actually work with you?"** → "Three rails, in order of readiness: deposits (organised group savings — granular and sticky), underwriting data (the Credit Passport for thin-file borrowers), and receivables — a host can already export a bank-facing statement of her circle: the forward inflow schedule, each member's reliability score, on-time percentage and collateral held. If a bank wants to finance against committee receivables, the underwriting artifact exists today. I'd genuinely value your read on which rail a bank would want first."

C. Competition & moat

- **"Oraan exists / will crush you."** → "Oraan is our best evidence: demand proven, licence proven. Different economics (fee vs profit-share), different circle formation (they match strangers; we digitise existing groups, preserving the social collateral), and layers they don't touch — Shariah architecture, the Credit Passport, the receivables export."
- **"easypaisa/JazzCash add committees tomorrow?"** → "Wallets move money; they don't organise groups, enforce discipline, or accrue portable reputations. Every wallet that tried social-finance features learned that distribution ≠ community trust. Meanwhile our reputation data compounds where it was earned."
- **"What's the real moat?"** → "Layered: audit-grade correctness (integer-paisa double-entry ledger, 262 automated end-to-end checks), the licensing queue, host-led trust earned cycle by cycle, and reputation data that can't be exported. Screens are copyable; those aren't."

D. Risk & controls

- **"Defaults will kill you."** → "Quantified, not asserted: calibrated 100k simulation, identical randomness with and without our stack — defaults 1.41%→0.27%, recovery 0%→90.4% of exposure, seventy percent of defaults fully collateralised. The mechanisms are all shipped: deposits sized to ninety percent of what a member still owes the group, a 15% payout holdback, credit-weighted ordering, graduated exposure for newcomers, a calibrated grace, progressive fixed penalties, platform bans with a rehabilitation path, and an opt-in auto-cover that settles a missed installment from the member's own vault savings."

- **"Simulations aren't reality."** → "Correct — I say it first on every slide. Calibrated to Findex, PMN and the ROSCA literature; and the model's claims are locked as automated tests so they can't drift. The pilot exists to replace the model with our ledger."
- **"Rates fall — the story dies?"** → "Backtested at −30% with everyone paying on the due date: the reference bonus floors around Rs 13,800, because the member-to-member component is rate-independent. And the safety value — not losing your pot — survives any rate regime."
- **"Your worst case is still a member absconding right after their payout."** → "Yes — that's the inherent risk every committee has carried for a century, and the honest number is: our collateral now fully covers seventy percent of even those worst cases, and recovers ninety percent of the exposed amount on average. A paper committee recovers zero. And credit-weighted ordering puts the most reliable members in those early, dangerous positions in the first place."
- **"Fraud/AML?"** → "Record-only means minimal AML surface today; KYC tiers, device and reference logging exist; the full AML program is a licensing-workstream deliverable, costed into the raise."
- **"You have CRYPTO in a savings app?!"** → "As governed risk, not as a pitch: 10/10 extreme rating, 'not government-backed' in red, invisible until a user deliberately raises the ceiling, a UI double-confirm AND an API-level acknowledgement (the server refuses a silent switch), personal vault only — **committees can never touch it**. It exists to prove the system can say no."
- **"What if YOU disappear with the data / the platform dies?"** → "Members' money never sits with us, so the worst case is losing a scorekeeper, not savings. Ledgers are exportable; the Passport is verifiable independently."

E. Shariah

- **"Is it actually halal? Who certified it?"** → "Design-intent halal, structurally: variable profit from real instruments, no priced turns in the halal path, penalties to charity, free swaps only in halal tiers. Nobody has certified it yet and we say so in-app; the Shariah board is a named milestone. What we refuse to do is blur the line — the conventional fee, market premiums and the crypto tier are labelled 'not Shariah-reviewed' on every screen they appear."
- **"The prize draw is gambling."** → "No stake, no loss: principal is never risked; only realised profit is gifted, by a deterministic draw anyone can replay. Framed as hiba, and explicitly pending board sign-off."
- **"The early fee is riba."** → "It may be — which is why it's quarantined, capped, opt-in, and labelled, with the halal alternative always one tap away. We'd rather lose a feature than launder one."
- **"Even your referral bonus — whose money is that?"** → "Ours. It comes out of Halqa's own Mudarib share, only after the referred member completes a clean cycle. Member balances are never touched for marketing."

F. Team, traction, tech

- **"Solo founder = key-man risk."** → "Today, yes — with a finished product carrying 262 automated end-to-end checks as evidence of execution. The raise wraps compliance and growth leads around me. One name and a working system beats five names and a deck."
- **"Traction?"** → "Pre-launch by design — record-only until licensed. The hard assets exist: the engine, the safety stack, the reputation layer, the receivables export, the test harness, a phone-installable app with Urdu built in."
- **"Who audits the numbers?"** → "The system is audit-ready by construction — double-entry, reason codes, idempotency keys, reproducible draws, profit-conservation tests. I'd genuinely welcome your technical adviser under the hood; that inspection is my best pitch."
- **"AI built this — anyone can replace you."** (full treatment in Report 7) → "AI collapsed the cost of typing, not of judgment, verification, licences, trust or data. The person furthest along the learn-build-verify loop stays ahead — and I'm months in with a tested artifact."

G. Fire-back questions (deploy after any two answers)

- "Where do you think deposit mobilisation for this segment goes in five years?"
- "If you were building the credit bureau for the undocumented, what would you need to believe?"
- "What did your years in [his institution] teach you about distribution at the bottom of the pyramid?"
- "If a bank wanted to finance against committee receivables, what would its risk team need to see first?"
- "What would make this a no-brainer for you?"

H. The never-say list (absolute)

- Never: "guaranteed" · "we hold/invest your money" · "riba-free" as a certified claim · an invented number · a valuation · criticism of Oraan · the internal grace-window percentage.
- When unsure: "Good question — I'd rather send the sourced answer than improvise one." That sentence has never lost a founder a deal; bluffing has.

Report 6 — FINANCE STUDY GUIDE (v3, expanded — written to teach)

Method: definition → why it matters to Halqa → the exact sentence you'd say aloud. Do one section per sitting; say the "aloud" sentences to a mirror. Seven days, seven sittings.

1. Money fundamentals (Day 1)

- **Principal vs profit.** Principal = money put in; profit = what it earns. *Halqa's iron rule: principal is sacred — savings and deposits always return in full; only profit is shared, tilted or gifted.* Aloud: "We never touch principal."
- **Annualisation.** A "10.8% annual" rate over 30 days pays 10.8×30/365 ≈ 0.89%. *The float sweep counts exactly this way, per payment, per day, clamped so nobody can backdate profit into existence.* Aloud: "We pay for the exact days money actually sat."
- **Simple vs compound.** Profit on principal vs profit-on-profit. *Vault balances effectively compound if left in; committees are simple-return by nature (each cycle settles).* The gap between the two is why "park your payout" is the single most valuable habit in the product.
- **Real return.** Nominal rate − inflation. With Pakistani double-digit inflation, cash idle for a year loses meaningful purchasing power. Aloud: "A paper committee's pool is melting ice; we plug the leak."
- **Liquidity.** Speed of converting back to cash without loss. *Why circle periods must exceed a scheme's liquidity window + our 7-day payout buffer — and why gold (3-day liquidity) is disabled for sub-10-day circles.* When you can explain that guard, you understand the whole engine.
- **The impossible triangle.** Return ↔ risk ↔ liquidity: pick two. Every scheme card in the Terminal is a point on this triangle; crypto is the corner case that maximises "return" by abandoning the other two.
- **Collateralisation.** Collateral ÷ exposure. *Halqa's deposits are sized to 90% of what a member still owes the group (cap 95%), which is why the simulation recovers 90.4% of defaulted exposure and fully covers 70% of defaults.* Aloud: "Our collateral is sized to the debt, not to a flat fee."

2. Islamic finance (Day 2 — this is our identity; know it cold)

- **Riba** — any guaranteed, fixed charge for the use of money itself; forbidden. *The chit-fund auction trap: early takers effectively pay interest to later ones. Our halal engines never price the turns.* Aloud: "Halal return must be variable profit from real assets — never a price on time."
- **Mudarabah** — capital (rab-ul-maal) + manager (Mudarib) share *actual* profit at a pre-agreed ratio; monetary loss falls on capital, the manager loses effort. *Our entire revenue model: 5% Mudarib share. Even our referral bonus is paid from the Mudarib share — marketing never touches member money.* Aloud: "If members don't earn, we don't earn — that's Mudarabah, not marketing."

- **Sukuk** — certificates over real assets' returns (not interest-bearing debt). Sovereign ~11.8%, corporate ~14% in our catalog.
- **Murabaha** — disclosed cost-plus trade finance; finances goods, not cash-lending.
- **Hiba** — a gift. *Our prize draw gifts realised profit only; principal is never staked; the draw is deterministic and replayable.*
- **Penalties→charity (iltizam bi-tasadduq)** — a late penalty may discipline, but must not enrich the counterparty. *Implemented in code: halal tiers route penalties to charity at completion*. This one detail wins any fiqh-literate room.
- **Gharar** (excessive uncertainty) — why everything is disclosed, dated and consented; ambiguity itself is the sin to avoid.
- **Takaful** — mutual Islamic insurance; useful vocabulary (a future partner category), not yet a feature. Note the family resemblance to auto-cover: a member's own savings covering their own slip is even cleaner than mutualised cover.

3. The instrument zoo (Day 3 — one line + one risk note each)

- **T-bills/PIBs** (~11.5–13.8%): lending to the state, 3mo–5yr; the PKR risk-free benchmark. Risk note: rate resets, reinvestment risk.
- **National Savings** (Behbood/Defence/SSC/RIC, ~12.8–13.7%): state retail certificates; very safe, fixed terms, early-encashment penalties.
- **Money-market funds** (~10.8–10.9%): overnight-ish parking in the safest paper; our float and Standard tier sleeve.
- **Income funds** (~12.1–12.2%): bond-heavy; a little duration/credit movement; our Income tier.
- **Balanced/asset-allocation** (~13–16%): equity-mixed; medium volatility.
- **Equity funds / PSX ETF** (~17–18%): ownership of listed companies; ETF trades like one share; years-horizon money; biggest swings in the mainstream catalog.
- **REITs** (~14.4%): listed property trusts; rent + revaluation without buying a building.
- **Bank deposits / Islamic Mudarabah deposits** (~11.2–11.5%): fixed deposits; the Islamic version shares actual bank profit; our deposit sleeve.
- **Gold-linked** (~15% indicative): the culturally-trusted inflation/rupee hedge; volatile in the short run, protective in the long run; halal. Remember the U Bank fact: roughly half its loan book is gold-backed — gold is mainstream collateral here, not an exotic.
- **Murabaha trade finance** (~13.4%): short Islamic trade exposure.
- **Microfinance deposits / private credit** (~13–16.5%): higher yield, real credit risk, slower exits.
- **Crypto** ("~30%" speculative): not backed by any government; can halve in weeks; in Halqa: personal vault only, double-gated, never committees. Aloud: "We list it to prove we can say no."

4. Banking vocabulary you'll hear from HIM (Day 4a — recognise, don't perform)

- **Receivables** — money contractually due to arrive. *A committee's future rounds are receivables; our exportable bank pack is literally a receivables statement: schedule + payer reliability + collateral.* If he says "financing structure backed by receivables," he is describing our export button.
- **Deposit mobilisation** — a bank's hunt for stable, cheap deposits; the MFB sector's chronic pain (concentration risk: a few big depositors dominating). *Our answer: thousands of small, sticky, organised savers.*
- **GLP (gross loan portfolio) / NPL (non-performing loans) / CAR (capital adequacy ratio)** — book size / bad loans / capital cushion. You don't carry any of the three — say so when relevant: "no lending, no NPLs, no CAR pressure; we're a data and organisation layer."
- **Thin-file borrower** — someone with no formal credit history. *The Passport's entire market.*
- **Field force** — the human agents who collect/disburse at the bottom of the pyramid. Digitising them was his FINCA win; our enforcement automation is the same idea applied to the committee's "field work."

4b. Startup-finance vocabulary (Day 4b — one usable sentence each)

- **TAM/SAM/SOM** — whole market / reachable / winnable-now. Ours: $5B annual flow / the smartphone slice of the 41% / thousands of host-led circles.
- **Unit economics** — per-user profit after direct costs; ours positive early (revenue = % of yield; cost ≈ software).
- **CAC / LTV** — cost to acquire vs lifetime value; hosts make CAC structural (one win = 6–20 members), vault balances make LTV compound, and referral spend (Rs 250) triggers only on a *completed cycle* — the cheapest honest CAC in fintech.
- **Take rate** — our cut: 5% of profit, 0% of principal (contrast: flat fees, trading commissions).
- **AUM / float / earning-days** — balances that earn; our true north-star metric.
- **Gross margin** — revenue minus direct cost; software-shaped here.
- **Burn / runway** — monthly spend / months of survival; ours engineering-lean; the raise buys licence + custody + distribution, not a rebuild.
- **SAFE / valuation cap / discount** — early-round convertible instrument and its ceiling; if terms come up: "not running a priced process — exploring fit."
- **Pre/post-money, dilution** — value before/after the cheque; ownership arithmetic. Don't negotiate live; ever.
- **Cap table** — who owns what; yours is clean (founder), which sophisticated angels love.

5. Regulation (Day 5)

- **SECP** — securities regulator; licenses NBFCs; run by exactly the calibre of people you're now talking to. Oraan's licence: SECP/LRD/107/OFSPL/2023 — memorise the number; citing it precisely signals you've read the actual document trail.
- **NBFC** — the class letting a fintech hold/manage client money without being a bank; our gating milestone.
- **SBP** — central bank: banks, MFBs, EMIs, wallets, Raast.
- **MFB** — deposit-taking microfinance bank (U Bank, ex-FINCA→ABHI, Khushhali...): our future partners for custody/deposits/underwriting/receivables.
- **EMI** — e-money institution (wallet licence; the route Finja took after SimSim).
- **KYC/AML** — identity + anti-laundering; one line: "minimal surface while record-only; full program ships with the licence."
- **Raast** — SBP instant free rail; the reason record-and-transfer costs members nothing.

6. Our numbers — the memorise-cold card (Day 6; tape to mirror)

- Market: **41% · $5B/yr · 30-pt gender gap · 1-of-8 unbanked countries · 24% vs 89% phone ownership.**
- Microfinance: **12.34M borrowers · Rs 604B loans · Rs 733B deposits · ~Rs 49k avg loan** (PMN Dec-24).
- Oraan: **$3.31M · 10k+ savers · 84% women · 170+ cities · NBFC licensed.**
- Us: **5% of profit / 0% of savings** · reference bonus **Rs 16,982** (floor **Rs 13,821** under stress; the Rs 15,000 promise clears even without pooled mode at **15,285**) · sim **1.41%→0.27% defaults, 90.4% recovery, 70% fully collateralised** · deposits sized to **90%** of remaining dues · newcomer cap **Rs 25,000** until one clean cycle · **25 unit + 262 integration checks** · fee cap **10%** · vault tiers **10.8 / 12.1 / 15 / (crypto 30 speculative)** · grace exists but its % is never disclosed.
- Day 7: run Report 5's punches + Report 7's copycat answers aloud; deliver the 6-minute script twice, timed, standing.

Report 7 — "CLAUDE IS A WEAPON, NOT A REPLACEMENT" (v3, expanded)

The theory, the counters, and — as ordered — zero glazing: where you're genuinely exposed. Private study document; the argument is for your mouth, the document is not for the meeting table.

A. The theory, properly argued

A.1 The historical law: general-purpose tools commoditise execution and re-price judgment.

- Every era's "unfair advantage" tool followed one curve: the spreadsheet (killed arithmetic, crowned modelling judgment), AWS (killed server rooms, crowned product judgment), Shopify (killed store-building, crowned brand & supply judgment), Photoshop/Figma (killed drafting, crowned taste).
- In each case, two things happened simultaneously: **the floor rose** (everyone could execute) and **the ceiling moved** (winners were decided by what execution could no longer decide). Nobody says "your store doesn't count, it's built on Shopify." The tool disappears into the baseline within one funding cycle.
- LLMs are the same law at a steeper slope: they collapse the cost of *producing* code, text and analysis toward zero — **for everyone at once**, which is precisely why the tool itself confers advantage on no one and shame on no one. An investor who discounts you for using the best available tools is applying a standard he applies to no other company in his portfolio.

A.2 What the weapon cannot supply (the residuals where value now lives):

- **Problem selection** — knowing the committee (not another wallet, not another BNPL clone) is the culturally-load-bearing wedge in Pakistan. Tool-users are everywhere; people who know *where to point the tool* are not.
- **Domain judgment** — Halqa embodies hundreds of adjudicated decisions: a fee curve that declines to zero, penalties routed to charity for fiqh correctness, deposits graduated to 90% of remaining dues, newcomer exposure capped until a proven cycle, a grace window calibrated but hidden, profit conservation to the paisa, crypto walled out of committees, a referral bonus that triggers on completion (unfarmable) and pays from the platform's own share (uncontaminated). A model executes decisions; it doesn't own them, sequence them, or defend them to a regulator.
- **Verification** — the expensive part of software was never typing; it was *trust*. 25 unit + 262 end-to-end checks, ledger invariants, seeded dual-armed simulations with CI-locked conclusions: a copier must reproduce the **assurance**, not the appearance. Assurance is slow even with AI, because it's made of decisions about what must never happen — and you only know what must never happen if you understand the domain.
- **Distribution & trust** — hosts, clean cycles, community credibility. No token stream emits users.
- **Regulatory position** — the SECP queue is measured in months, lawyers and capital, not prompts.

- **Data accrual** — reputations and payment histories compound where they were earned and cannot be prompted into existence elsewhere. Every completed cycle on Halqa widens a gap no copier can close retroactively.

A.3 The weapon metaphor, made precise.

- A weapon multiplies force but decides nothing: two soldiers with identical rifles are not equal — aim, terrain, logistics and nerve dominate. Two founders with identical AI tools are not equal — question quality, verification discipline, domain depth and distribution dominate.
- Corollary: the compounding loop. Better judgment → better questions → better artifact → better data → better judgment. Whoever is further around this loop *accelerates away* as long as they keep moving. The copier doesn't copy your position; they copy your starting line from months ago — and the loop has moved since.

A.4 The mirror argument (use with care; it's the kill-shot):

- "If AI makes my product worthless because anyone could rebuild it, then it makes every incumbent's software worthless too — including the banks'. Obviously it doesn't. Because what it actually devalued is *typing*, and what it revalued is everything my last months actually consisted of: deciding, verifying, and being accountable."

A.5 The precedent he already accepts.

- Every bank he has worked in runs on software written by contractors and vendors — the institution's value was never "we typed the core banking system ourselves"; it was the decisions, controls, licences and trust wrapped around it. You are making exactly the same claim at founder scale. He has believed this argument his entire career; he just hasn't heard it applied to AI yet.

B. Saying it in the room — three registers

- **Six seconds:** "It's a weapon, not a replacement. Weapons don't aim themselves, pass audits, win licences, or earn a mohalla's trust."
- **Thirty seconds:** "Modern tools collapsed the cost of writing code for everyone — so they advantage no one and embarrass no one. What got re-priced upward is judgment, verification, regulation and trust. Our 262 automated checks, the paisa-exact ledger, the Shariah architecture, the calibrated default model — those aren't typing. That's the part I did, and the part a copier restarts from zero."
- **The counter-punch (once, smiling):** "Honestly, the question that should worry you is the opposite one — why would you back any founder who's still paying five engineers to move slower than one person with the best tools?"

C. No glazing — where you are ACTUALLY vulnerable, and what closes it

- **The tool is symmetric.** A diligent copier gets 80% of your *screens* in weeks. True and unchangeable. What they can't get in weeks: assurance, licence, hosts, data. But note the tense — those are **your moats only once they exist**.
- **Most of your moats are currently potential, not built:** no licence yet (a plan, not a wall) · no live users yet (no data accrual, no host network) · solo founder (real key-man risk; he will price it).
- **Therefore your lead is perishable.** Six stalled months ≈ a funded copier catches the artifact. The defence is **velocity + conversion**: file the licence path, run pilot circles, mint the first hundred real reputations, sign the first host cohort. Every shipped week widens the gap; every idle week closes it.
- **Do not overclaim the tech moat.** To an operator who has run bank engineering, "my code can't be copied" is instantly false and costs you the room. The senior move is the inverse: *underclaim the code, overclaim the discipline* — "the code is the cheapest part; audit the tests and the ledger."
- **What actually makes YOU hard to replace** (say without arrogance): compressed context. Every trade-off, simulation result, fiqh decision and failure mode of this system lives in one head, attached to a working artifact that proves the judgment was sound. A replacement wouldn't need to retype the code — they'd need to re-derive the judgment. That re-derivation is the real cost, and it's the thing your months bought.
- **And the uncomfortable truth to own privately:** if you stop learning the finance, the regulation and the market yourself — if the tool becomes a substitute for understanding instead of an amplifier of it — then you *are* replaceable, because your only asset would be access to a tool everyone has. The reports you're studying this week are the moat-building. Do the reps.

D. One-line close for any version of the question

- "Tools are rented by everyone; judgment, verification, licences, trust and data are earned by someone. I've banked the first two — the raise is how we earn the other three before anyone else does."

Report 8 — INTERESTING FACTS (v3, expanded conversation ammunition)

Drop one naturally per topic-turn; each signals you've done the reading. Never recite a list.

The instrument itself (ROSCAs)

- The same invention appears independently on every inhabited continent: kameti/BC (Pakistan), chit funds (India), tandas (Mexico), susu (Ghana/Caribbean), hui (China), gam'eya (Egypt), tontines (Francophone Africa), cundinas, ajo (Nigeria), paluwagan (Philippines). Humanity keeps rediscovering the rotating pool because it solves saving, credit and commitment in one social object.
- India formalised it: the **Chit Funds Act 1982** regulates a legal, multi-billion-dollar chit industry with registrars, foremen and security deposits — proof the endgame of "committee → regulated instrument" exists. (Its scams — Saradha etc. — were custody frauds wearing chit clothing; the distinction is your talking point: regulate the custody, keep the instrument.)
- Economists have taken ROSCAs seriously for decades — Besley, Coate & Loury (AER, 1993) is the canonical model — and the recurring empirical puzzle is how *rarely* socially-embedded ROSCAs default with zero legal enforcement. Social collateral is real collateral — which is exactly why Halqa digitises **existing** circles rather than matching strangers: the product inherits the collateral instead of destroying it.
- A committee is three products fused: a savings account, an interest-free loan (early turns), and a commitment device (you can't skip the gym when the gym is your neighbours). Banks struggle to displace it because they unbundle what people want bundled.
- In high inflation, an early turn is a **free inflation hedge**: collect today's rupees, repay in cheaper ones. Late turns carry the inflation cost — which is precisely the unfairness Halqa's patience tilt finally compensates (1.0→2.0× profit weight, first→last).
- Committees are substantially women's finance in Pakistan — organised by women, for household goals; Oraan's base is 84% women. Formal finance's worst-served population runs the informal system's best-performing instrument.
- The committee's genius is that its "interest rate" is social, not financial: the cost of defaulting is your standing in the community. Halqa's ban + Credit Passport system is that same cost, made portable and permanent.

Pakistan's market

- ~41% of Pakistanis have participated; ~US$5B/yr rotates (Oraan research, TechCrunch 2021). Only ~7% of Pakistani women were financially included per the same research — the gap the committee fills.

- Findex 2025: Pakistan is 1 of 8 countries holding ~650M of the world's 1.3B unbanked; ~30-pt gender gap in accounts; 24% vs 89% phone ownership (women vs men). The phone-ownership gap is why assisted, host-led, Urdu-capable onboarding is a strategy, not a nicety.
- Microfinance (PMN, Dec-2024): 12.34M active borrowers — **~72% of all borrowers in the entire financial system** — yet only Rs 604B in loans (avg ~Rs 49k) against Rs 733B deposits, via 4,145 branches in 139 districts. Enormous reach, thin wallet share: the segment saves *around* banks, not in them.
- The average microfinance loan (~Rs 49k) is roughly one committee payout. The instruments already substitute for each other in household life — only one of them currently builds a credit file.
- Raast made P2P transfers free and instant — the state quietly built the rail that makes digital committees costless to operate.
- Gold is the collateral Pakistan actually trusts: U Microfinance Bank reports roughly **half its loan book gold-backed**. (Your vault's Gold tier and the create-flow gold hedge speak this dialect natively.)

Our product (facts that surprise even technical people)

- **Conservation law:** across a full cycle, member bonuses sum *exactly* to the real profit created; fees are pure member-to-member transfers. The ledger cannot invent a rupee — and a test fails the build if it ever could.
- The Rs 16,982 reference bonus is an **automated test**, not a slide: code that breaks the promise cannot ship. Under stress (rates −30%, everyone paying at the deadline) the same engine still yields Rs 13,821 — also a test.
- The Rs 15,000 promise no longer needs the pooled mode at all: the monthly-dividend Sigma configuration alone reaches Rs 15,285. The engine got stronger when the *protection* got stronger — raising deposit coverage to 90% enlarged the Mudarabah base that earns for members. Safety and yield turned out to be the same lever.
- Deposits are **productive collateral** — sized to 90% of what a member still owes the group, they protect the circle AND earn Mudarabah yield, and always return in full.
- In halal tiers, late penalties go to **charity** (the classical iltizam bi-tasadduq position) — implemented in code, not in a brochure.
- The prize draw stakes nothing: only realised profit is gifted, and the winner comes from a deterministic hash anyone can replay. Provably fair, in the literal sense.
- The default model is **dual-armed with identical randomness** — the same 100,000 simulated Pakistanis live the same year twice, with and without Halqa: defaults 1.41%→0.27%, recovery 0%→90.4%, 70% of defaults fully collateralised. And those claims are CI-locked.
- Newcomers are capped at Rs 25,000 circles until they complete one clean cycle — graduated exposure, enforced in code the way a good host enforces it socially.
- Auto-cover makes a member's own savings their default insurance — no pool, no premiums, no moral hazard.

- A host can export a **bank-grade receivables statement** of her circle in one tap: future inflow schedule, each member's reliability and collateral. The document a banker would ask for, generated by a housewife's phone.
- The referral bonus (Rs 250) triggers only when the referred member *completes a full cycle* — unfarmable by fake signups — and is paid from Halqa's own revenue share, never member money.
- Crypto exists in the product so the system can demonstrably **say no**: extreme-rated, double-gated (UI confirm + API refuses a silent switch), personal vault only, permanently barred from committees.
- A member's Credit Passport is verifiable by any lender through a signed link — without a Halqa account. The informal economy's first exportable credit file.
- The whole app installs to a phone home screen (PWA), flips to Urdu with full right-to-left layout in one tap, and the assistant is a 3D bot that reacts to your actual payments.

Competitive landscape

- Oraan's founders raised Pakistan's first women-led fintech seed (2021) and later secured the SECP NBFC licence — the regulatory bar is proven clearable by a committee startup.
- The wallet graveyard (SimSim among them) teaches the sector's hardest lesson: **free features lose to trusted distribution** at the bottom of the pyramid. Hence Halqa's growth unit: the host who brings her existing circle, not the stranger who downloads an app.
- Nobody in the market — bank, wallet, or fintech — currently combines yield-on-committees, Shariah-labelled architecture, portable reputation, and bank-ready receivables data. That quadruple is the open crown.

Report 9 — WHO YOU'RE MEETING: SHAHID HOSAIN KAZI (v3, expanded)

Verified public profile, his lived lessons, your hooks, his likely punches, and the meeting plan.

(All facts from public sources, live-checked; inferences marked. His LinkedIn is login-walled to tools.)

A. Verified facts

- **Current roles:**
  - **CEO, Rozee.pk** (Pakistan's largest jobs platform) since Dec 2021 — succeeded founder Monis Rahman, who moved to Executive Chairman. Announced across Profit/Pakistan Today, ProPakistani, AIM Group.
  - **Independent Director, U Microfinance Bank** — verified on ubank.com.pk's board page: "Mr. Shahid Hosain Kazi — Independent Director… over 30 years of leadership experience in banking, fintech, and digital transformation."
- **Career arc (sourced):**
  - Education: **IBA Karachi** (Pakistan's premier business school).
  - Earlier banking: **Emirates Bank**, **Bank Alfalah**.
  - **Habib Metropolitan Bank** — SEVP, Corporate & Transaction Banking (large corporate financing + transaction-products portfolio). Note what "transaction banking" means: receivables, collections, cash management — the plumbing of money owed and money arriving. He has professionally underwritten receivables for decades.
  - **FINCA Microfinance Bank — COO, then Acting CEO**: launched **SimSim** (Pakistan's first free smartphone wallet, with Finja, 2017) and digitised a ~1,000-person field force, cutting SME loan disbursement **7 days → 24 hours**.
  - ~27–30 years total across banking, fintech, digital transformation.
- **Institutional context he carries (know these cold):**
  - **SimSim's fate:** despite being free and first, it lost to easypaisa/JazzCash brand + distribution; Finja exited to an EMI licence; FINCA later became ABHI Bank. His lived lesson: *distribution and trust beat features at the bottom of the pyramid.*
  - **U Bank:** PTCL/e& subsidiary; 350+ branches, 210+ cities; heavy rural/agri book; **~54% of the loan portfolio gold-backed**; 2023–24 capital squeeze resolved by PTCL (pref-share conversion Rs 1,000M + sub-debt conversion Rs 1,200M + Rs 1,200M cash → CAR ~15.4%); historical **deposit concentration** (top-5 ≈ 38%). His lived lessons: *capital discipline, deposits are precious and hard, gold is the collateral Pakistanis trust.*

- **Rozee today:** pushing employee **financial-wellness** products — salary-linked finance for its job-seeker/employer base.

B. What he believes (inference, grounded in the record)

- Distribution > product features; trust > tech; unit economics > vision decks.
- Deposits are the crown jewels of any bottom-of-pyramid institution; concentration is danger; granularity is safety.
- Digitising *field operations* (his FINCA win) creates more value than digitising interfaces.
- Gold is not exotic — it's half his bank's book.
- Receivables are underwritable when you can see the schedule and trust the payer — that's transaction banking's whole worldview, and he lived it at HabibMetro.
- He has seen a wallet die and a bank need rescue: he prices regulatory drag and burn honestly, and he can smell a founder who hasn't.

C. Your hooks, mapped to his life

- **Gold vault tier / gold hedge** ⇄ U Bank's ~54% gold-backed book: "the asset your depositors already trust is the one our vault speaks."
- **Committees as deposits** ⇄ U Bank's concentration pain: "granular, sticky, low-cost — thousands of small savers instead of five big depositors."
- **The receivables pack** ⇄ his transaction-banking career: a host can export, in one tap, the exact statement a receivables banker asks for — forward inflow schedule, per-member reliability score, on-time percentage, collateral held, all ledger-derived. Sentence for him: "If a bank ever wants to finance against committee receivables, the underwriting artifact already exists — I'd value your read on what a risk team would want added." This is the single newest, sharpest hook in the deck — a bridge from informal savings to bankable paper, in his native professional language.
- **Credit Passport** ⇄ MFB underwriting cost: "verified repayment histories for thin-file borrowers, delivered as a by-product of saving."
- **Auto-cover & protection stack** ⇄ his risk instincts: default quantified (1.41%→0.27%, 90.4% recovery, 70% fully collateralised), not asserted — and newcomer exposure capped until a first clean cycle, which is precisely how a credit officer thinks.
- **Urdu/RTL one-tap toggle** ⇄ U Bank's rural, assisted-service reality: flip it live in front of him; it says "built for the actual user" louder than any slide.
- **Rozee synergy (float as a QUESTION, never a pitch):** "Would salary-day goal circles — fees, weddings, Hajj — make sense for Rozee's employer base?" Let him own the idea.
- **His FINCA loans win** ⇄ your enforcement automation: "you digitised the field force; we digitised the committee's discipline."

D. The six hardest questions HE specifically will ask — and your counters

1. **"What's your cost of acquiring a circle, and who collects cash from members without wallets?"** → "Hosts are the unit — one trusted organiser brings 6–20 members, so CAC is a relationship, not a media buy. Referral spend pays only on a completed cycle, from our own share. And members already pay each other — Raast, wallet, or cash — we record references; we didn't change anyone's money habits."

2. **"SimSim was free and first, and still lost. Why do you win distribution?"** → "Because our growth unit isn't a download, it's an existing circle. The committee already meets, already trusts, already pays monthly — we don't create the network, we equip it. Free features lose to distribution; we *are* the distribution."

3. **"Whose balance sheet holds the float? Under what licence?"** → "Nobody's, today — deliberately record-only until the SECP NBFC path or a custodian partnership. Frankly, an MFB like yours is the natural custodian — I'd value your view on how a bank would want that structured."

4. **"Your default numbers are simulated. What's real?"** → "Correct, and I say it first: calibrated model, published assumptions, conclusions locked as automated tests. The *mechanisms* — deposits at ninety percent of remaining dues, holdbacks, scoring, newcomer caps, auto-cover — are built and end-to-end tested; the pilot's purpose is replacing the model with our ledger."

5. **"Committee receivables aren't bankable paper — no contracts, no recourse."** → "Today they're informal, agreed. What we've built is the *data* layer that bankability needs: a ledger-derived schedule, payer reliability history, and collateral coverage per member. Recourse and structure are exactly the design conversation I'd want a banker in — the statement exists; the wrapper is the partnership."

6. **"What do you want from me?"** → "Today? Your read on the space, and where this model is naive. If it earns a second conversation, I'd want your advice on the bank-partnership structure before I speak to anyone else."

E. Meeting plan

- **Open** (after pleasantries): the committee's three flaws — fragile, unrewarding, invisible — then the 41%/$5B line. He'll finish the thesis in his own head before slide 4.
- **Language:** use MFB vocabulary sparingly and correctly — GLP, deposit mobilisation, CAR, field force, thin-file, receivables. One wrong term costs more than ten right ones earn. (Report 6 §4 has the recognition list.)
- **The SimSim touch:** honour it, never critique it — "the wallet era taught the whole market that trusted distribution beats free features; we built on that lesson." (He *built* it; let him nod.)
- **Offer inspection early:** "Your technical adviser is welcome under the hood — 262 automated checks and a double-entry ledger read better than any deck." Operators trust audits, not adjectives.

- **Demo order on the phone (90 seconds max, only if he leans in):** home in English → one-tap Urdu flip → a circle's Protection tab (live collateral coverage) → the Bank pack button. Four beats, each one aimed at his biography.
- **Ask him real questions** (he advises for a living): deposit mobilisation's future · what made the 7-days→24-hours loan win work · what a committee-receivables feed would need to be bankable.
- **Never:** pitch a valuation · claim Shariah certification · overclaim tech moats · bluff a banking term · mention the internal grace percentage · bad-mouth Oraan, Finja, or any wallet.
- **Close:** "What would make this a no-brainer for you?" — then silence. Let him fill it.

F. Pre-meeting checklist (morning of)

- ☐ Phone: app installed to home screen, logged in, one committee open, vault showing tiers, Urdu toggle rehearsed.
- ☐ Printed: one-pager + this report's section D folded in your pocket (not visible).
- ☐ Numbers cold: 41% · $5B · 12.34M · Rs 604B/733B · 0.27%/90.4%/70% · 16,982 (floor 13,821) · 5%/0% · Rs 25k newcomer cap.
- ☐ Two questions for him memorised. ☐ Typos: zero. ☐ "Recorded, not held" — twice.
