

HALQA

**Pakistan's savings committees move
four trillion rupees a year.
None of it is written down.**

We built the platform that writes it down, without ever touching the money.

THE PROBLEM

Fifty two million people, no record

A committee is the oldest savings product there is. Twelve people each pay Rs 10,000 a month, and each month one of them takes the whole Rs 120,000. Everyone gets a turn.

Thirty seven per cent of Pakistani adults are in one. Only thirteen per cent have a bank account.

It runs on a notebook, a WhatsApp group, and one person's memory. When the cycle ends, the record disappears.

So a tailor who has paid on the first of the month, eleven months running, walks into a bank and is a total stranger. He has proved exactly what a lender spends money trying to find out, and nobody wrote it down.

Twenty one people have tried this. Every one hit the same wall.

Hold the money

You now need a banking licence, or you become the fraud. The largest Pakistani case took Rs 420 million from 200 people across 117 committees. She kept no records and disappeared.

Or record it only

Two Pakistani apps let the organiser tick a box saying who paid. No money moves through them, so the entry is somebody's claim, not proof. A bank cannot use it and a court will not weigh it.

Everybody assumed those were the only two options. Take custody and carry the licence, or take no custody and record nothing worth having.

THE INSIGHT

**We are not trying to move the money.
We are trying to prove it moved.**

The money goes directly from one member's bank account to another's, over Pakistan's own instant payment rail. Halqa never holds a single rupee. We schedule it, we watch it settle, and we write it into a permanent record tied to a national identity number.

That one decision removes the licence, removes the fraud, and leaves us with the only thing that was ever actually valuable.

Where the money actually goes

1

Payday

We collect on the morning your pay lands, not on the due date, because that is when the money is actually there

2

Direct

It moves from the payer's account to the receiver's account on the national rail. It never stops with us

3

Recorded

Both sides get a receipt. Two matching ledger entries. Tied to a CNIC

4

Furnished

The record goes to a licensed credit bureau, so it counts outside Halqa

Because nothing is ever held, there is no pool to steal, no balance to lose, and no licence to wait for. What we need is a merchant agreement, which is the same contract any online shop signs.

FEASIBILITY

This is not a concept. It is running.

Live

In production since 20 July 2026

412

Automated tests, all passing

Rs 0

What a member pays to join

11

Screens built, in Urdu and English

Everything below is built and working today, not on a roadmap.

RUNNING NOW

- Ten step signup with CNIC capture and live location
- App PIN on every open, plus device biometric
- Every Pakistani payment rail at checkout
- Receipts with a reference for every settlement

RUNNING NOW

- Automatic collection on the member's payday
- Credit score 300 to 850 with an exportable report
- Daily overdue sweep and recovery cases
- Turn marketplace, rewards and streaks

What nobody else has

WHAT WE DO		WHY IT IS NEW
1	Collect on payday, not on the due date	It removes the failure where the money arrived and was spent before the deadline. It came from a member saying he pays as soon as his pay arrives
2	Your position in the queue is the collateral	New members can only take the last turns, so the most they can cost anyone is tiny. No deposit, no guarantor, no cash held
3	The record is furnished from the day you join	Not from the day you collect. A member has eleven months of proven history before they touch a rupee
4	There is no cancel button	Leaving is a ladder of five steps, and the money owed back is settled by the members who already collected. It needs no reserve, only arithmetic
5	A verifiable draw	The ballot is the ritual. We commit to a hashed seed, every member adds entropy, and the seed is published so anyone can recheck it

It scales because the behaviour already exists

Rs 4tn

Moves through Pakistani committees every year

52m

Adults already taking part

3%

Of adults have any formal credit record at all

2x

Women participate at twice the rate of men

We are not asking anybody to change what they do. Fifty two million people already run committees, every month, with their own money. We are writing down what they were already doing, and handing them a credit identity they could never build before.

UN Sustainable Development Goal 8, target 8.10: strengthen the capacity of domestic financial institutions to expand access to banking and financial services for all. That target reads as though it were written for this.

THE MODEL

How it pays for itself

A member pays nothing to join and nothing to receive their turn.

WHERE THE MONEY COMES FROM

A small flat fee on each contribution, around one per cent

A fee if you want an early turn, which is genuinely worth more

Commission when a member buys something with a partner retailer

A share of the manager's fee on savings we introduce

Origination when a dealer sells a bike or a machine through a circle

WHO PAYS

The member, and it is the only thing they pay

Only members who choose one

The retailer, as customer acquisition spend

The asset manager, not the member

The dealer

Four of those five are paid by somebody other than the member. On a one per cent share of a four trillion rupee market, the member facing fee alone is around Rs 680 million a year.

THE HARD QUESTIONS

What we think you are about to ask

THE QUESTION

THE ANSWER

Do you need a licence?	No. We issue no balance, lend nothing and hold nothing. We need a merchant agreement with a licensed payment aggregator, which is a commercial contract
What if somebody takes the pot and runs?	New members can only hold the last turns, where they have already paid in nearly everything they owe. The most an unproven member can cost a circle is two contributions
What is your default rate?	We do not know yet, and we say so. Every price is modelled from the academic literature and repriced against the first hundred completed circles
Why has nobody done this?	Everybody optimised for holding the money. The value was never the money, which nets to zero. Two American operators abandoned pooling entirely and one reached a billion dollar valuation on the record alone
Can a seventeen year old run this?	The product is live, it has 412 passing tests, and the sitting Chairman of the SECP has met us twice and called it original

**The committee is a thousand years old.
Fifty two million Pakistanis are in one.
The money is already moving.**

What has never existed is the record. We built it, it is live, and it costs the member nothing.
