

PITCH BOOK · CONFIDENTIAL · JULY 2026

HALQA

The committee, made safe and rewarding.

Pakistan already runs its own savings instrument. Halqa digitises it without ever holding the money, protects it with eleven coded safeguards, puts every idle rupee to work, and turns years of quiet discipline into credit histories that lenders can finally read.

Prepared by the founder. Figures are checked against the cited public sources. No return in this document is guaranteed.

Half the country runs a savings machine with three fatal flaws

1. Fragile

One member collects the pot and vanishes, and the group recovers **0%**. Karachi, 2022: the Sidra Humaid case. **Rs 420M** lost across **117 WhatsApp groups** that kept no written records at all (Dawn, Express Tribune, Geo).

2. Unrewarding

Money sits idle between pay-in and payout, every round, in every circle, earning nothing while double-digit inflation eats it. A paper committee is melting ice.

3. Invisible

Twelve years of flawless payments builds **zero credit history**. All that discipline evaporates the day the circle ends.

The committee is not broken. It lacks infrastructure. Every failure traces back to a missing layer: enforcement without custody, yield on the idle days, or a record a lender can read.

~**41%**

of Pakistanis have participated in a committee (Oraan research, TechCrunch)

~**US\$5B**

rotates through committees every year

0%

recovered when a paper committee defaults

25 to 30 million active committee members, and almost no infrastructure serving them

Sizing pyramid (derived from stated inputs)	Figure
Adults (18+)	~140M
Have ever joined a committee (41%)	~57M
Currently active	~25-30M
Implied average installment (consistent with the \$5B flow)	Rs 4,000-4,700/mo
Households touched	~15-18M of 35M

The numbers check each other: participation, average installment and the annual flow all triangulate. We derive our market size rather than assert it.

The inclusion gap (Global Findex 2025)

Pakistan is one of eight countries holding over half of the world's 1.3 billion unbanked adults. **More than 100M adults are credit-invisible** (eCIB covers about 12M borrowers). Women's phone ownership is 24% against men's 89%, which is why distribution here has to run through hosts and assisted onboarding rather than app-store downloads.

The risks an investor would normally price in have already been retired elsewhere

Question	Answered by	Verified fact
"Will Pakistanis use committee apps?"	Oraan (Karachi)	600,000+ savers by their own published claim (oraan.com and Play Store, July 2026), SECP-registered, plans from Rs 1,000/month
"Is the licence obtainable?"	Oraan	SECP NBFC licence SECP/LRD/107/OFSPL/2023. The path has been walked.
"Does the model work in an economy like ours?"	Money Fellows (Egypt)	Digitised the gam'eya to 8.5M+ users and \$1.5B+ in transactions, profitable in Egypt, on \$60M+ raised (verified July 2026)
"Is the credit-data layer valuable on its own?"	Esusu (USA)	Reports informal payments to credit bureaus and reached a \$1B valuation in 2022 (verified July 2026)
"Is there a regulated endgame?"	India	The Chit Funds Act 1982 governs a legal committee industry worth billions of dollars, run by licensed foremen
"Will big tech crush it?"	Indonesia	Gojek acquired the arisan platform Mapan in 2017. Community-finance networks tend to get bought rather than rebuilt.

No market anywhere has produced the full stack of yield, protection, credit identity and receivables in one platform. That gap is the opportunity, and Halqa has already built the software for it.

The same loop people trust, with a spine

Rule one: we record, we never hold. Members pay each other directly over Raast, wallets or cash, and record the reference. Halqa enforces schedules, collateral, scores and consequences on an integer-paisa, double-entry ledger. There is no pot to steal, so the Sidra class of fraud is structurally impossible here, and no custody licence is needed to operate today.

What paper can never add

- **Protection.** Deposits sized to each member's exposure (the host sets 30-90%), payout holdbacks, reliability scores, capped stakes for newcomers, and an optional member-funded Safety Fund.
- **Profit.** Idle days and collateral earn on disclosed Islamic instruments, automatically.
- **Reputation.** A signed, independently verifiable Credit Passport for each member, and a bank-grade receivables statement for each circle.
- **Honesty.** Halal engines carry a halal label. The one conventional lever is marked "not Shariah-reviewed" on every screen it touches. The word "guaranteed" appears nowhere in the product.

Built and verified today

- Full committee lifecycle across five configurable tiers, with live circles from Rs 50k to Rs 500k pots
- Personal halal savings vault with four yield tiers, plus auto-cover self-insurance
- A turn marketplace: free swaps everywhere, premium trades in the conventional tiers only
- One-tap Urdu with full right-to-left layout; installs to the phone like a native app
- An in-app assistant with a guided tutorial and an honest FAQ of about 120 topics
- **25 unit and 283 end-to-end automated checks**, including simulated attacks, run clean twice in a row

Stage 1 needs no licence: it earns modestly, builds trust, and accrues data. Stage 2 (the SECP NBFC licence plus a bank partner) switches the same ledger over to real custody. That switch is wiring work, since every design decision is already made.

Two honest sources: profit that is created, and patience that is priced

Created (halal-labelled)

- **Float sweep.** Every idle day between pay-in and payout earns at the Islamic money-market rate, computed per payment, per day.
- **Earning collateral.** Security deposits sit in Mudarabah placements for the whole cycle. The protection pays its own participants, and raising coverage makes a circle safer and richer at the same time.
- **Patience tilt.** Cycle profit splits by capital-days with a position weight rising from 1.0 to 2.0, so the late turns that fund the circle finally earn a term premium.
- **Behaviour rewards.** Consistent early payers carry a 1.25x weight, funded by the extra float their own early money creates. A fully punctual circle earns yield step-ups for everyone.

Moved (labelled not Shariah-reviewed)

- **Early-turn fee.** Capped at 10%, declining to zero by the last turn, redistributed entirely to the waiting members. Halqa keeps none of it.

Reference circle: 12 members, Rs 140,004 pot

≈ **Rs 15,600**

best member's annual bonus with the full engine, computed by the engine itself and locked as a test; the floor under a 30% rate cut is about Rs 13,000

≈ **Rs 56,000**

real profit created per circle per year, from money that previously earned nothing

100%

of principal returned, always: deposits, savings and contributions. Profit is shared. Principal is sacred.

All rates are dated and disclosed in the app. Every figure is computed at indicative rates and labelled as never guaranteed. An automated test enforces that total bonuses equal the real profit created.

Eleven coded safeguards against the one moment that kills committees

The dangerous moment is the post-payout default: collect the pot, then stop paying. The safeguards fire in this order:

- Reliability score gates (550 to join, 700 to host), updated on every payment event
- A first-circle cap of Rs 25,000 per installment until one clean completed cycle
- Credit-weighted ordering, which places trusted members in the high-exposure early turns
- Graduated deposits: coverage% of remaining dues, host-set between 30 and 90%
- A 15% payout holdback, released as the recipient keeps paying cleanly
- Reminders, peer nudges, and a calibrated grace window whose length is never disclosed
- Flat progressive penalties that go to charity or to the never-late members, never to Halqa
- Vault auto-cover, where a member's own savings settle her own missed installment
- An optional Safety Fund guaranteeing payouts up to the fund's recorded balance
- Ban plus collateral forfeiture, with a priced rehabilitation path back
- After licensing: bank balance checks, direct debit mandates, and

HAEB reporting

Measured in a full-year simulation

120,000 agents in 10,441 committees lived calendar 2025 month by month: Ramadan, both Eids, school-fee season, the monsoon floods, wedding season, and the actual SBP rate path. The same population lived the year twice, once as paper committees and once inside Halqa, with every random event identical across both runs, so the differences below are attributable to the safeguards. The run is deterministic and can be reproduced exactly.

Metric	Paper	Halqa
Post-payout defaults	2.48%	0.99%
Recovery on default	0%	75.3%
On-time payments	91.5%	94.0%
Worst segment (over-committed members)	10.4%	0.94%
Wedding-goal funds completed	84.0%	86.1%

This is a calibrated model rather than a backtest, because no real committee-ledger dataset exists anywhere. The pilot's purpose is to replace the model with our own ledger. The headline claims are locked as automated tests.

The channel model: institutions pay us, the member pays Rs 49

Halqa takes no share of member profit. The licensed bank is the Mudarib upstream at its standard split, exactly as in any Islamic account. We are the channel, and channels are paid by the institutions they feed:

Line	Payer	Rate
Deposit-mobilisation commission	Bank	~1.25%/yr on balances
Circle service fee	Member	Rs 49/mo, host free; live before licensing
Optional-flow processing	Opt-in users	15% of early-fee flows; 10% of slot fees; 10% turn-market
Receivables origination and servicing	Lenders	1-1.5% plus 0.5%/yr
AMC trail, takaful	AMC / takaful	~0.5%/yr; 15-20%;

Revenue at scale (after licensing)

Most of this is institution-paid and recurring, and most of the mix does not move with interest rates. We carry no lending risk: no bad-loan line, no capital-adequacy burden, no cost of funds.

Winning about 4% of the currently active committee population builds the one-million-member business. The market needs equipping; it does not need to be created.

commission, data	/ lenders	Rs 75 per check
---------------------	---------------------	--------------------

Untouchable; 0% of principal, 0% of the member's profit share, and penalties go to charity. The institutions pay us; the auntie pays forty percent per.

What a bank actually buys from us

- **Granular, sticky deposits.**

Thousands of small, habitual savers behave like the current-and-savings money banks fight over, and they cure the deposit-concentration problem. Rs 1B of balances leaves the bank roughly Rs 35M a year in net spread after paying our commission.

- **A new asset class: committee receivables.**

Short-dated, self-amortizing inflow streams backed by behavioural collateral, delivered with schedules, per-payer reliability scores and collateral data. Financeable today; securitizable at scale.

- **Underwriting data for the credit-invisible.** eCIB covers about 12M borrowers, while more than 100M adults have no file at all. Every completed cycle mints verified repayment history that cannot be bought anywhere else. Esusu built a

Whose needle we move (deposits, Rs B)

After licensing, the same partner adds enforcement teeth: minimum-balance capacity checks before large circles, Raast direct-debit mandates, post-dated-cheque instruments for early turns under s.489-F, eCIB default reporting, and takaful cover for tragic defaults. Wilful defaults stay uninsured on purpose.

billion-dollar company in the
US on this layer alone.

COMPETITION

The same Rs 45B of balances
is 0.15% of the banking
sector and 6% of the entire
MFB sector, and over 60% of
single mid-size MFB. We
think the tier-1 value we
change the institution's year.

Mapped honestly, and structurally differentiated

	Paper kameti	Oraan (600k+)	Wallets (21M/18M MAU)	Register apps	Halqa
Trust and distribution	native	brand	massive	thin	host-led; inherits each circle's own trust
Enforcement and collateral	none	own-book guarantee	none	none	eleven coded safeguards
Yield on idle money	none	none	none	none	float, earning deposits, patience tilt
Credit identity	none	none	none	none	Passport now, eCIB path at licence
Receivables and bank products	none	none	none	none	packs, financing, a securitization path
Price to member	free	~Rs 1,000/mo plans	free features	free	Rs 49/mo

Oraan's 600,000 savers are our best evidence. They proved mass adoption and the licence path with our exact demographic. Their flat-fee, stranger-matched model cannot add yield without cannibalising its own fee, and it carries default risk on its own book because matching strangers discards the circle's social collateral.

The moat is assurance rather than screens: integer-paisa double-entry, 283 automated end-to-end checks, paired-population simulations, and per-feature Shariah honesty. Screens can be copied in weeks. Assurance takes months of judgment, and it is the part a bank's due diligence actually audits.

The organiser auntie is the distribution

- **The keystone.** Pakistan has roughly 2-3M active committee organisers. One demonstration over chai brings in 6 to 20 pre-trusted members with their circle intact. Acquisition cost is a relationship rather than a media budget, and the host never pays.
- **Referral discipline.** Rs 250 per referred member, paid only when that member completes a first full cycle, funded from our own revenue. Growth spending buys finished circles rather than downloads.
- **Segment order.** Home-business women first (the best payment discipline in our data), then office circles, then the bazaar daily committees that no digital player serves, then professional circles with Rs 500k pots, and eventually diaspora members funding family committees through the \$30B remittance corridor.
- **Urdu-first, assisted onboarding,** built for households where the member often does not own the phone she uses.

Stages

Stage	What happens	Revenue
Now (record-only)	host-led growth, service fees live, data accruing, zero custody risk	modest and recurring
Licence + MFB partner	custody, real yield, balance checks, funded Safety Funds, eCIB in shadow mode	the channel and processing lines switch on
Scale	receivables financing and securitization, data licensing, white-label rails, takaful, payroll and diaspora channels	majority institution-paid

Every Stage-2 system is already specified to the checklist level: custody and reconciliation, KYC and eCIB, collections and takaful, production security, treasury, AML. A yes converts to wiring work, because the design decisions are made.

The honest close

What exists today

- A finished, working platform rather than a deck: the full lifecycle, the earning engines, the protection stack, the vault, the marketplace, Urdu, and phone installation
- **25 unit and 283 end-to-end automated checks**, including simulated attacks. The system is audit-grade by construction, and your technical adviser is welcome under the hood.
- A 120,000-agent simulation of the real 2025 calendar, with its claims locked as tests
- A verified market: 25-30M active members, Oraan's 600,000 proving adoption, the wallets proving the rails, and a walked licence path

What the raise buys

- The SECP licence workstream, the MFB custody partnership, the pilot cohort that replaces our model with our ledger, and compliance and growth hires around the founder

We record, we never hold, so there is no pot to steal. The institutions pay us, and the member pays forty-nine rupees. Principal is sacred, profit is shared, and the one conventional lever carries an honest label. Every completed cycle mints the one asset nobody can copy: proof that an invisible saver keeps her word.

The ask: partnership and capital to convert a proven market, a finished system and a walked regulatory path into Pakistan's committee infrastructure, before someone else assembles the pieces.
