

Halqa — Complete Feature and Process List

24 September 2026, revision 3. Every feature and process, with one line on how each works. Each payment splits at source into a contribution, a takaful contribution where cover is attached, and Halqa's service fee. Collection runs through a licensed electronic money institution on a three tier ladder, and the service fee is the only money Halqa receives. Counterparties are named in section 28; none is contracted at this date.

1. Account and identity

Feature	How it works
Signup	A phone number is entered, a one-time passcode is sent to it, and the number becomes the account identifier.
Application PIN	Set at signup and required on every open, independent of the device lock.
PIN lockout	Repeated failures introduce a backoff and then a lock, cleared only by re-verifying the phone number.
Profile before joining	Full name, address, city and occupation are captured before a circle can be joined.
CNIC capture	The whole card is scanned with the device camera, with manual entry for a handset without one.
Identity verification	The captured number and name are checked against the national register through NADRA Verisys.
Face match	A live capture is compared to the stored identity at exit and at other high value actions.
Verification levels	Each completed check raises the account level, and each level opens a wider set of seats and circles.

Feature	How it works
Account title match	The registered holder name on a bank or wallet account must match the CNIC name before it anchors collection.
Linked accounts	Payment accounts are added and removed by the member, each verified by title before use.
Device binding	A session is tied to the device that created it, and every active device is listed and revocable.
Session expiry	Tokens expire on a fixed schedule and can be revoked server side without waiting for expiry.
Signup velocity limits	Repeated account creation from one device or address is rate limited and then blocked.
Bot protection	Automated signup attempts are challenged before an account is created.
Consent capture	Every consent is stored with the text version, a hash of it, the originating address and the time.
Account closure	An account with no open obligation can be closed, with the record exported first.

2. Eligibility and standing

Feature	How it works
Credit score	Built inside Halqa from the member payment record and shown as a figure with a plain explanation.
Score bands	Four bands decide which seats may be claimed, and never change the order once a circle has started.
Affordability gate	Total committed instalments are held to one third of declared income, against a regulatory norm of two fifths.
Income verification	A verified income figure reduces the assessed burden,

Feature	How it works
	which widens the seats available.
Exposure score	Obligations across every circle held are summed, so a second circle is assessed against the first.
Forward liability	The amount still owed after a seat collects is measured at the point of selection.
Seat bands	Forward liability is capped, which is the mechanism that offers or withholds an early seat.
New member confinement	A member with no history may claim only the final seats in a circle.
Graduation	Two clean circles and completed verification release that confinement.
Salary pattern	The days on which collection succeeds are used to infer a pay day, without reading any bank screen.
Payment attempts	Every attempt, successful or not, is logged as evidence of whether funds were present that day.
Circle risk engine	The circle is scored from its roster and configuration, and the score drives the policy applied to it.
Risk band	The circle score resolves to a band shown to the host before the circle starts.
Reputation	Standing inside a circle is visible to the other members of that circle.
Related accounts	Accounts that appear connected are surfaced to the host before admission.
Cooldown	A member coming off a default waits a set period before joining anything new.
Feature lock	While a default is open, creation and joining are blocked.

Feature	How it works
Eligibility preview	Before joining, the available seats are shown along with the reason each unavailable seat is closed.

3. Credit bureau

Feature	How it works
Bureau instruction	On a screen of its own, the member instructs the named bureau to release the report. It is not a line in the terms.
Instruction record	The instruction is stored with its hash, address and time, which is what makes it provable.
Bureau relationship	A subscriber agreement with TASDEEQ carries the commercial and format terms, with DataCheck as the alternate.
Report retrieval	The bureau releases the report on the member instruction, and Halqa is the conduit rather than the requester.
Scale	Reports arrive on the bureau scale, which is narrower than the internal score and is held separately.
State register	The State Bank credit register is closed to non banks and is not a source.
Band assignment	The report contributes to which seats are open and to nothing else.
Adverse action pack	Where a report restricts a seat, the member receives the report, the bureau contact details, a summary of rights and a statement that the bureau did not decide.
Disclosure limits	Bureau derived information is not shown to other members without authority.
Score movement	Clean completion raises standing and a default is recorded against it.

Feature	How it works
Repayment reporting	Halqa payment history is written back once the Federal Government notifies furnishers that are not credit institutions.
Dispute route	A disputed report is referred to the bureau correction process and the entry is marked while the dispute is open.

4. Creating a circle

Feature	How it works
Guided wizard	Creation runs as a sequence of steps, each showing only the decisions relevant to it.
Name	The circle is named by the host and the name appears wherever it is referenced.
Contribution	The instalment each member pays per round is fixed at creation.
Member cap	The number of seats is fixed at creation and determines the pot.
Pot	Contribution multiplied by the number of seats, shown before the circle is created.
Cadence	Weekly, fortnightly, monthly or daily, with the period in days derived from it.
Start condition	A minimum number of members must have joined before collection begins.
Confirming window	A fixed window before the start in which members confirm and may still withdraw.
Join policy	Open until full, or invitation only.
Public listing	An open circle can be listed for discovery or kept off the list.

Feature	How it works
Invite code	Every circle carries a code that resolves to its join sheet through a link.
Collection order	Set by rule at creation or assigned by the host.
Roster fill	The host may allow Halqa to fill remaining seats from members seeking one.
Expected payment window	The host states how many days before the due date payment is expected.
Goal	A circle may carry a named target, which appears on the card and in the schedule.
Fee preview	The exact fee per instalment for the configuration is shown before creation.
Identity assertion	The configuration is refused at creation where the pot does not equal the contribution multiplied by the number of rounds.
Policy summary	The finished configuration is restated in plain words for confirmation.
Creation record	The configuration is stored immutably and later changes are recorded as amendments.

5. Joining a circle

Feature	How it works
Join by code	A code or link opens the join sheet directly.
Join by invitation	The host sends an invitation that resolves to the same sheet.
Join from discovery	Listed circles are browsable and filtered to those the member is eligible for.
Join sheet	States the contribution, the number of rounds, the total commitment, the pot and every fee before signature.

Feature	How it works
Split disclosure	Where a payment is split, the join sheet states each part and its destination before signature.
Seat selection	The seat is chosen by the member from those the band allows.
Turn date preview	The collection date is shown before commitment.
Affordability check	The gate runs at this point and blocks a commitment that cannot be carried.
Undertaking	The platform undertaking is signed before any obligation runs.
Mutual guarantee	Signed at join, member to member, and the circle cannot start until every member has signed.
Collection mandate	Where automatic collection is chosen, the mandate is authorised on its own screen and its terms are stated there.
Host admission	The host admits or declines each applicant and the decision is recorded.
Waiting list	Applicants beyond the cap are held in order and promoted if a seat is released.
Withdrawal before start	Within the confirming window a member may withdraw with no consequence.
Roster view	Every member sees who else is in the circle and their standing.
Start	When the minimum is met and the window closes, the schedule is generated and the first round opens.

6. Seats and collection order

Feature	How it works
Seat selection at join	Seats are chosen at join rather than assigned

Feature	How it works
	afterwards.
Band gating	Only permitted seats are shown as available; the rest carry the reason they are closed.
Forward liability gate	An early seat is withheld where the remaining obligation after collection would be too large.
Host assignment	A host may set the order directly instead of leaving it to selection.
Order lock	Once the circle starts the order cannot change except by an exit or a swap.
Seat fee	The fee payable to Halqa is the same for every seat and is shown before selection.
Flat fee	On every cadence the fee does not vary by collection day, so the price cannot be read as a charge for time.
Later seat compensation	Members in later seats receive points and fee waivers issued by Halqa.
No member to member payment	No member pays another member for a position, in any circle and under any setting.
Round numbering	Rounds run in sequence, each with one collecting member and one due date for the rest.
Turn reminder	The collecting member is reminded before the round opens in order to confirm the destination account.

7. Collection

Feature	How it works
Schedule	Every due date and the turn date are projected from the start and shown as a list.
Round opening	A round opens on its date, creating an obligation for every member except the collector.

Feature	How it works
Due date	Each obligation carries a date derived from the cadence and the round number.
Grace window	A fixed period after the due date in which nothing is recorded against the member.
Reminders before the due date	Reminders escalate before the due date rather than after it.
Collection ladder	Three tiers: payment initiation by the partner on the member's approval, a mandate collected without a prompt, and a transfer the member sends over Raast.
Tier one, partner initiation	The member approves the instalment inside the application and the electronic money institution partner debits the member and credits the collecting member, over Raast where available.
Tier two, mandate	A token held by the partner authorises collection on the due date without a prompt, used where the daily cadence makes a prompt impractical.
Tier three, member sends	The member sends over Raast to the collecting member's Raast ID shown in the application, and the payment is matched by its reference.
Mandate authority	The mandate is a preauthorised electronic fund transfer, which the payment systems statute provides for expressly. Its duties fall on the member's bank and the partner, and it requires no licence of Halqa.
Mandate register	Every mandate is recorded with its account, its ceiling, its cadence and the text the member authorised.
Mandate cancellation	A member cancels a mandate inside the application at any time, and the cancellation is effective without a call or a form.
Advance notice	Where an amount will differ from the amount stated when the mandate was taken, notice is given in

Feature	How it works
	advance of the collection.
Mandate visibility	The circle shows which members are on automatic collection and which pay manually.
Failed collection	A failed attempt is recorded, the member is told the reason, and no further attempt runs without a stated schedule.
Arrears to the member left short	A missed amount is recorded as arrears owed to the member it left short, and is never recorded as a negative balance held by Halqa.
No stored value	No member balance is created at any point, because a balance would be a claim on Halqa.
Payment initiation	A rail is chosen and the application produces an instruction for it.
Manual recording	Cash and bank transfers are recorded against a reference and confirmed by the host.
Settlement	A payment settles when the provider confirms it, or on host confirmation for a manual record.
Idempotency	Every settlement carries a key so a repeated instruction cannot double count.
Receipt	Each settled payment produces a receipt naming the rail, the reference, the round and each part of the split.
Set off	A member collecting in the same round has their own instalment netted against the pot.
Partial payment	A short payment is recorded as such and the balance remains due.
Overpayment	An excess is carried forward against the next instalment.
Round position	The round view lists members by payment state, as

Feature	How it works
	people rather than as figures.
Round close	When every obligation is settled or written off, the round closes and the payout is released.
Ledger entry	Every movement is written as a double entry against named accounts.
Audit entry	Every action that changes state is written to an append only log with the actor.
Reconciliation	The ledger is checked against the partner's settlement report on a schedule.

8. Payment rails

Feature	How it works
Partner agreement	A services agreement with a licensed electronic money institution, which initiates payments and holds the mandate for Halqa as a third party service provider.
Raast	The national instant rail, operated by the State Bank, at negligible cost and preferred wherever a prompt is workable.
Request to pay	A Raast Request to Pay settles to the merchant that sends it, so Halqa sends one only for its own fee and never for a contribution.
Token mandate	The partner holds a token against the member account or card and collects against it on the due date.
Mandate pricing	Charged by the partner, indicatively one and one half per cent of the amount collected, to be confirmed.
Rail cost against a flat fee	A percentage rail consumes a rising share of a flat fee as the instalment grows, which is why rail selection is set by instalment size rather than by preference.

Feature	How it works
Wallet rails	JazzCash and Easypaisa, charged by the wallet to the member.
Bank transfer	Recorded against a reference and confirmed rather than charged.
Cash	Recorded by the host against a reference, for members outside the rails.
Rail selection	The rail is chosen at the point of payment and the choice is remembered.
Instruction	A live rail returns a pending instruction and a deep link rather than settling immediately.
Callback	The provider confirmation arrives on a signed callback and settles the payment.
Signature verification	Every callback is verified before it is acted on.
Retry and backoff	A failed call is retried on a schedule rather than dropped.
Circuit breaker	Persistent provider failure suspends initiation and directs members to another rail.
Refund and reversal	A payment taken in error is reversed through the same rail and the ledger entry is reversed with it.
Title inquiry	The registered holder name is fetched and matched before an account is used.
Rail cost display	Any wallet charge is shown before that rail is chosen.
Position of Halqa	Money moves from payer to collecting member through the partner. Halqa instructs the partner and keeps the ledger, and never holds the money.
Present state	No rail is connected and no money has moved through the system.

9. Payout

Feature	How it works
Payout release	When the round closes, the pot is released to the verified account of the collecting member.
Single payment control	Concurrency control ensures a round pays out once and only once.
Account confirmation	The destination account is confirmed before release.
Payout record	The payout is written to the ledger and to the member statement.
Payout receipt	A receipt is issued naming the round, the amount and the rail.
Shortfall handling	Where a member has not paid, the shortfall is stated and the payout proceeds against the amount collected.
Post payout obligation	The remaining instalments are restated, since this is the point of greatest risk.
Standing effect	Collection without subsequent default raises standing; default after collection damages it heavily.
Turn date accuracy	The projected turn date updates whenever a round runs early or late.
Completion	When the last round closes the circle completes and every member record is written.

10. Fees, points and waivers

Feature	How it works
Payment split	A payment resolves at source into a contribution to the pot, a takaful contribution where cover is attached, and a service fee, separately ledgered and never mixed.
Contribution	Passes from the paying member to the collecting

Feature	How it works
	member through the partner and is the only part that enters the pot.
Takaful contribution	Passes to the participants risk fund held by the licensed operator, and belongs to the participants rather than to Halqa or to the operator.
Service fee	Halqa's own revenue, charged in advance for a service, which is what keeps it revenue rather than a deposit.
Fee grid	A flat fee per instalment between one hundred and five hundred rupees, set by instalment size and roster size.
Flat within a circle	The fee does not vary by the day a member collects, because a price graded by waiting is a price on time.
Fee schedule	The whole grid is published in the application and shown before any commitment.
Fee collection	Collected at the same time as the instalment as a separate payment to Halqa, and ledgered apart from it.
Fill uplift	An addition to the fee where Halqa rather than the host fills the remaining seats.
Rehabilitation fee	Charged where a defaulted position is restored at the member request.
Points	Issued by Halqa to the later seats as compensation for waiting.
Fee waivers	Issued by Halqa to the later seats and applied against future fees.
Redemption against fees	Applied automatically at the next charge, with the reduction shown.
Redemption with a commerce partner	Points are redeemable against goods with a commerce partner, which turns an internal credit into value the member can use.

Feature	How it works
Commerce partner candidates	Daraz, foodpanda and Careem.
Points balance	Visible in the application with the history of how each point was earned.
Referral reward	Paid in points, on value carried rather than on recruitment depth.
Host reward	Paid in points on circles that complete cleanly.
Distribution commission	Earned from the asset manager once savings are offered, and disclosed.
Agency commission	Earned from the takaful operator where cover is taken, and disclosed.
Revenue account	All of the above land in the Halqa company account, never in a member account.
No other income	No share of any member to member amount and no share of fund profit.

11. Default prevention

Feature	How it works
Affordability gate	Blocks a commitment beyond one third of income before the seat is granted.
Forward liability gate	Withholds the earliest seats where the remaining obligation would be too large.
Band confinement	Standing decides which seats are available, which places the least proven members last.
New member rule	No history means the final seats only, until two clean circles are completed.
Host vetting	Every member is admitted by a named host who carries the removal test.

Feature	How it works
Mutual guarantee	Members guarantee one another, which is what gives the circle standing to act.
Undertaking	Ten clauses signed at join, framed to support a summary suit.
Guarantee cheque	A cheque held on file takes 80 per cent off the fee and opens a route under section 489-F of the Penal Code.
Salary account linkage	Required on any roster of members who are strangers to one another.
Related accounts	Connected accounts are shown to the host before admission.
Pay day alignment	Collection is scheduled against the inferred pay day rather than an arbitrary date.
Early payment window	The host sets how early payment is expected and reminders follow it.
Escalating reminders	Reminders increase in urgency before the due date, not after it.
Feature lock	An open default blocks joining and creating anything new.
Exposure ceiling	Total obligations across circles are capped, so commitments cannot be stacked.
Circle risk band	The host sees the circle risk band and can tighten its policy before it starts.
Collapse threshold	Expected loss on a circle is measured against the cover accumulated for it, and the circle is stopped before the two cross.
Stress bands	The threshold resolves to green, amber or red, so intervention is graded rather than a single stop.

12. Delinquency and recovery

Feature	How it works
Delinquency sweep	A scheduled pass finds every obligation past its grace window and acts on it.
Late ladder	Three steps at increasing intervals, each with a stated penalty.
Penalty destination	On Shariah labelled circles the penalty is given to charity at the end of the circle rather than kept by Halqa.
Standing damage	Applied in proportion to the step, and heavily where the member has already collected.
Recovery case	Opened at the third step, tracked, and closable on payment.
Host notification	The host is told and given the tools to make contact.
Member contact	A member who makes contact is routed to the hardship path rather than to escalation.
Hardship statement	The member position is recorded, the fine is waived and a revised date is set.
Cure	Meeting the revised date restores standing in part.
Silence	No contact routes the case to restitution rather than to a collections call.
Restitution arithmetic	What is owed is computed and published rather than negotiated case by case.
Guarantee call	The mutual guarantee is the instrument the other members rely on.
Takaful claim	Where cover is attached, the claim is made to the operator against the payment record.
Acceleration	The remaining balance falls due on a recorded default.

Feature	How it works
Summary suit	The undertaking is framed as a liquidated demand, so a summary procedure is available as a last step.
No collections calls	At no stage does Halqa or a host telephone a member to demand payment.
No contact lists	No contact list is read and no third party is contacted about a member debt.
Write off	An unrecoverable amount is written off, recorded, and reflected in standing.
Return path	A member who settles later rebuilds standing through clean circles.

13. Exit and transfer

Feature	How it works
No cancel button	No single action ends a commitment, because the obligation runs to the other members.
Exit ladder	Five levels, from pausing a payment to leaving the circle, each with its own condition.
Exit sheet	Shows the arithmetic of leaving before anything is confirmed.
Cooling window	Twenty four hours between requesting and confirming an exit.
Confirmation	PIN and face match are both required to confirm.
Restitution	The leaving member settles their own position; nothing is held by Halqa to cover it.
Mandate on exit	Any collection mandate is cancelled as part of the exit, without a separate request.
Seat transfer	The seat passes to a replacement at no price and the circle continues unbroken.

Feature	How it works
Host removal test	A host may remove a member against a published test rather than at will.
Member vote	Where the circle policy requires it, the other members vote on a removal.
Guarantee release	The leaving member is released from the mutual guarantee only once restitution is complete.
Record	An exit is recorded with its reason and reflected in standing.
Circle dissolution	Where too many members leave, the circle is wound down against published arithmetic.

14. Positions

Feature	How it works
Turn swap	Two members exchange positions at no price, with both consenting.
Swap listing	A member lists the position held and the position wanted; no amount appears.
Swap approval	The host approves the swap and both bands must permit the new positions.
Seat transfer on exit	A vacated seat passes to a replacement at no price.
No premium	No amount passes between members for a position, in any circle and on any tier.
Asset circles	Held until a leasing structure exists under which a licensed partner owns the item until the circle finishes paying.
Gold circles	Held until settlement can be same day, which is what the Shariah label requires.
Merchant sponsored circles	Later, where a merchant funds part of a goal circle in

Feature	How it works
	exchange for the sale.

15. Host tools

Feature	How it works
Roster admission	The host admits or declines each applicant and sees their standing first.
Order assignment	The host may set the collection order where the circle policy allows.
Payment confirmation	The host confirms cash and bank payments against a reference.
Chase tools	A reminder can be sent to a named member from inside the circle.
Delinquency view	The host sees who is late, by how long, and which ladder step has been reached.
Mandate coverage	The host sees what proportion of the roster is on an authorised mandate, since that proportion drives the collection rate.
Removal	The host may remove a member against the published test.
Policy settings	The host sets the expected payment window and, within limits, the circle tolerance.
Circle health	The host sees the circle risk band and the standing spread of the roster.
Host accountability	Every admission and removal is recorded against the host.
Host reward	Points on circles that complete cleanly, which aligns the host to completion rather than to volume.

16. Messaging and notices

Feature	How it works
Circle chat	Every member of a circle can post, and messages are attributed and kept with the circle.
Notices	System events appear as notices inside the circle and in the member feed.
Activity feed	One feed across every circle held.
Payment reminders	Sent before the due date on an escalating schedule.
Consolidated daily notice	On the daily cadence one notice carries the position for the day, rather than one message per member per day.
Mandate notices	Advance notice of a differing amount, and confirmation of every collection taken under a mandate.
Turn notice	The collecting member is told before the round opens.
Payout notice	Sent when the pot is released, with the receipt.
Messaging channel	Delivered over the WhatsApp Business Platform on approved templates.
One time passcodes	Sent on the same channel, rate limited and bound to the requesting device.
Delivery failure	A failed send is retried and then surfaced in the application.
Preferences	Notification types are selectable, with a working unsubscribe.
Assistant	An in application assistant answers questions about circles held and about the rules.
Language	The interface runs in English and Urdu, with the choice remembered.

17. Records and statements

Feature	How it works
Statement	The full ledger for a position in a circle, exportable.
Receipts	Issued for every settled payment and every payout, producible as proof.
Split statement	Each part of a split payment is shown separately, so the member can see what reached the pot, the risk fund and Halqa.
Schedule	Every due date and turn date, updated as rounds run.
Payment history	Every attempt and settlement with the rail and the reference.
Mandate history	Every mandate authorised, varied or cancelled, with the text and the time.
Standing history	Every movement in the score with the reason.
Agreement archive	Every document signed, with its version and hash.
Audit log	Append only, covering every privileged action, retained separately.
Double entry ledger	Every movement recorded against named accounts, with debits equal to credits.
Reconciliation report	Ledger against provider settlement, produced on a schedule.
Data export	A member record can be exported in full.

18. Legal instruments

Feature	How it works
Member undertaking	Ten clauses, expiring if unsigned, signed by an adopted signature matching the account name.

Feature	How it works
Signature capture	Typed name with an optional drawn mark, stored with a hash, address and time.
Liquidated demand	The undertaking states the sum as a liquidated demand, which makes a summary procedure available.
Acceleration clause	The remaining balance falls due on default.
Collection mandate	A separate instrument authorising preauthorised transfers from the named account, stating the amount, the cadence, the ceiling and how to cancel.
Arbitration clause	Names the dispute route before a dispute arises.
No custody clause	States expressly that Halqa holds no member money at any point.
Mutual guarantee	A separate instrument, member to member, not to Halqa.
Bureau instruction	A separate instrument addressed to the bureau rather than a term of service.
Takaful participation	The operator's own participation document, taken through Halqa as agent.
Member agreement and policies	Agreement, privacy, cookies, advertising, community and fees, versioned together.
Electronic validity	Electronic records, signatures and system output are recognised and admissible by statute.
Counsel review	The undertaking, the guarantee and the mandate text are to be reviewed before real money moves.

19. Money-laundering controls

Feature	How it works
Customer identification	Identity established and verified from independent sources at onboarding.

Feature	How it works
Beneficial owner	Identified and verified where an account is not plainly personal.
Sanctions screening	Names screened at onboarding and periodically after.
Politically exposed persons	Flagged for enhanced review rather than blocked.
Ongoing monitoring	Patterns across circles are monitored against the stated profile.
Velocity limits	Circle creation and joining are rate limited per member and per device.
Fraud rules	Repeated identity submissions and unusual account linking are flagged.
Record retention	Identity and transaction records retained for the statutory period.
Reporting readiness	The system can produce a suspicious transaction report if the obligation is ever held.
Position	Halqa transfers no value and holds no funds, so the statutory definition is not met.
Open question	Whether the intermediary limb of the definition reaches Halqa is a written question for counsel.
Data residency	Where records sit is documented, and the position is reviewed if lending adjacent activity begins.

20. Takaful cover

Feature	How it works
Underwriter	A licensed takaful operator writes and prices the cover. Candidates are Pak-Qatar Family Takaful and Salaam Takaful.
Risk fund	Contributions sit in the operator participants risk fund, under the operator licence.

Feature	How it works
Ownership of the fund	The fund belongs to the participants collectively. The operator manages it and does not own it.
Deficit	A deficit in the fund is met by an interest free advance from the operator, recoverable only from future surplus.
Surplus	A surplus belongs to the participants and is distributable to them under the operator rules.
Role of Halqa	Registered corporate insurance agent, distributing the operator product.
Registration	Corporate insurance agent registration with the Commission, carrying no capital requirement.
Income	Commission from the operator, computed on contributions the operator has received, and disclosed to the member.
Why not in house	The Insurance Ordinance admits only a public company, so a private company cannot be registered as an insurer at all.
Product	Cover against a member of the circle defaulting, priced by the operator on the circle risk.
Purchase on a standard circle	Offered at circle creation and at join, priced per member and shown before commitment.
Cover on the daily cadence	Taken as a fixed part of every daily payment, so cover accumulates alongside the exposure it answers. Counsel's opinion on regulation 10(c) is required before the product opens.
Claim	Made to the operator, with Halqa supplying the payment record as evidence.
Settlement	Paid by the operator directly to the member left short, in that member's own name, as regulation 7(4) requires. Never paid to a circle.

Feature	How it works
Disclosure	The underwriter, the exclusions and the commission are disclosed, and the cost of cover is shown apart from the committee, as regulation 11(1)(d) requires.
Status	Held until the agent registration and an operator agreement are in hand.

21. Savings: trustee and asset manager

Feature	How it works
Structure	A licensed asset management company manages a fund whose assets are held by a trustee.
Asset manager	Mahaana Wealth is the candidate, being a digital first manager already licensed.
Trustee	The Central Depository Company of Pakistan.
Trust deed	Constituted on paper between the asset manager and the trustee before any member is involved.
Money path	Member to the trustee collection account, direct, never passing through Halqa.
Units	Issued in the member own name and held in the member own account.
Role of Halqa	Registered distributor and nothing more.
Execution only	A menu is presented and nothing is recommended, which keeps advisory licensing out of scope.
Income	Distribution commission from the asset manager, disclosed.
No profit share	No share of fund profit and no management fee.
Redemption	Units are redeemed through the same path, back to the member own account.

Feature	How it works
Disclosure	Returns are stated as indicative and never guaranteed, with the fund named.
Precedent	The structure already operates in market at a one thousand rupee minimum subscription.
Status	Held until the distributor registration is in hand.

22. Products

Feature	How it works
Standard circle	Contribution in, pot out, fee to Halqa, nothing else.
Goal circle	A standard circle with a named target shown throughout.
Hyper circle	A daily cadence circle offered in two fixed configurations, each with its own roster, cycle length and pot. Every daily payment splits three ways at source, the fee is flat across the roster, and there is no bidding and no rate. The figures for both are set out in the Hyper Committee document, which is the only document carrying calculations.
Savings circle	A standard circle whose pot can be directed into the fund at the member choice, once stage two opens.
Covered circle	A standard circle with operator cover attached, once the agency is in place.
Asset circle	Held, pending the leasing structure.
Gold circle	Held, pending same day settlement.
Employer circle	Later, with collection by payroll deduction.
Remittance circle	Later, over a licensed rail, with Halqa never holding foreign exchange.
Shariah labelling	Features are never removed for being non compliant;

Feature	How it works
	the label is simply not applied where it does not hold.

23. Algorithms and engines

Feature	How it works
Score engine	Builds the internal score from payment behaviour, tenure and completion.
Score bands	Maps a score to the seats that may be claimed.
Exposure engine	Sums obligations across circles and caps the total.
Affordability engine	Applies the income ratio and the verification discount.
Forward liability engine	Computes what remains owed after a given seat collects.
Seat band engine	Turns forward liability into the set of seats on offer.
Risk engine	Scores the circle from its roster and configuration.
Split engine	Resolves each payment into its three parts and writes each to its own ledger account.
Threshold engine	Measures expected loss against accumulated cover and produces the green, amber or red band.
Time value engine	Measures the difference between an early and a late seat, which sets the points and fee waivers issued to later seats. It never sets a price.
Rewards engine	Issues points for waiting, for clean payment and for referral.
Discounts engine	Applies waivers against fees.
Exit ladder engine	Computes the cost and conditions of each exit level.
Delinquency engine	Walks obligations through the grace window and the ladder.

Feature	How it works
Mandate engine	Holds the mandate register, schedules collections against it, and honours cancellations immediately.
Salary pattern engine	Infers a pay day from successful collection days.
Settlement engine	Applies payments to obligations, handles set off and closes rounds.
Fee book	Holds the fee grid and resolves the fee for any configuration.
Reputation engine	Maintains the standing shown inside a circle.

24. Security

Feature	How it works
Transport security	Enforced across the domain with strict transport headers.
Content policy	A restrictive content security policy with framing denied.
Cross origin policy	Only the application origins may call the service.
Rate limits	Applied per route, per member and per address, tighter on authentication.
Authorisation guards	Every route checks membership, hosting or ownership before acting.
Input validation	Every request is validated against a schema before reaching business logic.
Output filtering	Internal fields never reach the client.
Secret handling	Credentials held in a managed store and rotated on a schedule.
Mandate token handling	Rail tokens are held by the partner and never stored by Halqa.

Feature	How it works
Identity artefacts	Identity images encrypted at rest with access logged.
Session control	Expiry, refresh and server side revocation, with a device list the member controls.
Administrative separation	Administrative access is separate from application access and held in named accounts.
Two factor on infrastructure	Required on hosting, database and domain accounts.
Dependency scanning	Runs in the build and fails it on high severity.
Secret scanning	Runs across the repository and its history.
Penetration test	Carried out before real money moves.
Incident response	A written plan with a named owner and a breach notification procedure.

25. Data and platform

Feature	How it works
Interface	A single web application, installable, built for a low end handset.
Application	A stateless service behind the interface, deployed close to the users.
Database	A relational store holding every circle, member, obligation and ledger entry.
Migrations	Schema changes versioned and applied in order rather than pushed directly.
Indexes	Every list query and every foreign key driving one is indexed.
Pagination	Every list is bounded, so growth does not degrade the application.

Feature	How it works
Caching	Static reference data is cached rather than fetched per request.
Job queue	Payouts, notifications, mandate collections and sweeps run as jobs rather than inside a request.
Scheduled work	The delinquency pass and the daily mandate run are scheduled and sharded to handle volume.
Backups	Point in time recovery plus an independent nightly copy, with a rehearsed restore.
Monitoring	Errors, latency and payment failure reported and alerted to a person.
Logging	Structured, with a request identifier carried end to end.
Staging	A separate environment with its own database for testing before release.
Rollback	A documented procedure for reverting a failed release.

26. Registrations and contracts

Feature	How it works
Incorporation	A private limited company registered with the Commission, with an object clause matching the model.
Tax registration	A National Tax Number, then provincial sales tax registration.
Company account	A bank account for Halqa own revenue only.
Partner services agreement	A commercial contract with a licensed electronic money institution, which holds the licence and the payment authorisation.
Mandate facility	An addition to the partner agreement permitting recurring collection against a stored token, which is a

Feature	How it works
	commercial term rather than an authorisation.
Identity agreement	A corporate agreement with NADRA for identity verification.
Bureau subscriber agreement	A commercial contract with TASDEEQ, on the bureau consent format.
Fee collection agreement	A merchant agreement with a payment aggregator, for Halqa's own fee only.
Corporate insurance agent registration	Required before cover is offered; carries no capital requirement.
Takaful operator agreement	A distribution agreement with the licensed operator.
Distributor registration	Required before savings are offered; permits distribution of funds.
Trademark	Filed with the Intellectual Property Organisation.
Not required	No electronic money licence, no payment service provider authorisation, no finance company licence, no peer to peer permission, no insurer registration, no payment system designation and no bureau licence.
No approval sought	Halqa operates under the general law and no sandbox participation is pursued.

27. Support and operations

Feature	How it works
In application help	Answers to common questions, written for a member with no financial background.
Assistant	Answers questions about circles held, inside the application.
Support inbox	A monitored channel with a stated response time and a person answering it.

Feature	How it works
Dispute route	A recorded path between members, and between a member and Halqa.
Mandate dispute	A disputed collection is reversed through the rail and the mandate is suspended while the dispute is open.
Complaint record	Every complaint logged with its outcome.
Runbook	Written procedures for the most likely failures.
Status page	Public, showing whether the service and the rails are working.
Dashboard	Signups, active circles, collection rate, mandate coverage and default rate, reviewed weekly.
Manual test script	The twenty most common journeys, walked before each release.
Release process	Type check, lint, tests and vulnerability scan on every change before it ships.

28. Counterparties

None is contracted at this date. Each is named as the intended or candidate counterparty for that function.

Function	Counterparty
Identity verification	NADRA, through a corporate Verisys agreement
Credit bureau	TASDEEQ, with DataCheck as the alternate
Instant payment rail	Raast, operated by the State Bank of Pakistan
Wallet rails	JazzCash and Easypaisa
Interbank switch	1LINK
Electronic money institution	NayaPay or SadaPay, to be confirmed against the State Bank register

Function	Counterparty
Payment aggregator	PayFast or Safepay, for Halqa's own fee only
Trustee	Central Depository Company of Pakistan
Asset manager	Mahaana Wealth
Takaful operator	Pak-Qatar Family Takaful or Salaam Takaful
Messaging	WhatsApp Business Platform
Points redemption	Daraz, foodpanda or Careem
Infrastructure	Vercel for hosting, Supabase for the database, Cloudflare at the edge
